I have an Anytone 5888uv – runs about $300. Supported by CHIRP which was one of my main considerations so I can keep my channels all in sync (I work with emergency management here so that becomes important and they use CHIRP too)

There's also an Alinco DR435T supported by CHIRP which is maybe $10 cheaper.

Not sure there is much below the $300 range for VHF/UHF and at least 25W output power other than getting a used one.

Hello,

I like this one:
http://smile.amazon.com/launch-TYT-TH-9800-TRANSCEIVER-Mobile/dp/B00IZYV6YW/ref=sr_1_1?ie=UTF8&qid=1426255773&sr=8-1&keywords=Tyt+8900

I have the Yaesu FT-8900 and this one seems the challenger when you compare price. It is a quad-band radio and if you do not want this and can possibly save some more try this one:
http://smile.amazon.com/AnyTone-Transceiver-AT-5888UV-Amateur-Radio/dp/B00B1F7IEE/ref=sr_1_1?ie=UTF8&qid=1426255962&sr=8-1&keywords=Tyt+8800

Hope this helps.

Thanks for all the replys, Yes, its true the weather band is pretty far from the 2 meter band. I just assumed that a slightly larger antenna would have to get better reception than the stock ones, seems to have worked in the past. I have already had to repair 2 of the stock antennas.

Correct. You can only cut an antenna for an optimum frequency range. Outside of that tuned area, performance will drop. With a dual band antenna, it is worse. You have to compromise in the design. You will get it to work. How good it works is another matter.

Subject: [baofeng_uv5r] Re: nagoya 701 disapointment

Correct me if I'm wrong, but when an antenna is "tuned" to make it higher gain in certain bands. (i.e. 144-150), doesn't it decrease the efficiency all the way around for freqs outside that "tune". I have a 771 and a 701. I find that the stock antennas pull in the weather and FM stations quite well, but are average on the actual 2m ham bands. My 701 seems to work a LOT better in the ham bands, but is crap for the weather channels.

Tery distant repeaters, or even better have a buddy do a simplex distance test.

No..software defined radio is where the decoding and encoding of signals takes place in software that is reprogrammable.

A quick check popped up this article if you want to hack the thing though….didn't see where anybody has hooked up any other software to it though.

Jetstream JT270M might be good. Look at my article on it in the "K9YA Telegraph." The "Goldilocks Radio."

It appears to be a re-purposed commercial radio for trucks, etc. 10 Watts, which is nice. Programmed with Chirp. There is also another version.

About $140, however. NICE radio -- I use it, among other things, as a police/fire scanner at the home QTH, and have an Alinco DR-605 as the main 2 meter/70 cm, using the Jetstream as backup, or for field use. Get a small sportsman's "dry box," a 5AH SLA gel cell, a whip antenna and a mount for it on the box, and you have a great "Go" box for field or emergency operations. The Jetstream comes with a mounting bracket, hand microphone with keypad, power cable, etc.

In the normal definition of the term, no they are not, since you can not use a computer to control the radio's normal functions while in use.

From: no6b@...
Topic: 49157 Message: 49157

Looking at the schematic for the UV-5R I see a BJT amp feeding the RDA1846. The RDA1846 itself is spec'd for a noise figure of 3 dB, so I kind of thought that front-end amp is unnecessary & probably responsible for the UV-5R receiver's poor dynamic range. So I found some YT videos that showed me out to crack it open, did so & shunted the collector & base of the that amp with a 10 pF 0805-size chip capacitor. I probably overdid it, as the sensitivity drop is noticeable - I'll measure it on the service monitor later this evening. But in the meantime I found that I can now hear my repeater in the parking lot at work, whereas before it was being covered up by noise as a result of receiver overload. The only problem is the squelch on that band is now acting very tight, even at the 1 setting. So for now I'm using squelch level 0 (open) with CTCSS decode. But I just read that the CHIRP software can reset the squelch level of each of the 1 through 9 squelch settings. Does this work with the UV-5R? If so, I may be able to fix this problem once I get a programming cable.

Bob,

Yes. This seems to work with all UV-5R variants (including the UV-82 and BF-F8HP) with a firmware version of BFB291 or newer (basically anything shipped since the end of 2012).

The more recent radios have the Squelch 1 setting set to 19. So you can lower it 18 units to "loosen" it up.

Unless you are running Linux or don't mind playing the "driver dance", get a programming cable with an FTDI USB-to-TTL chip. Baofeng Tech is one of several sources.

Sounds like I should be able to loosen it enough. I may end up cracking the radio open one more time to drop that capacitance a bit, though the next lowest value chip capacitor I have is 4.7 pF, & I'm not sure if that one is 0805 or 0402; if the latter I don't think I'll attempt it. Hard enough to hand-solder 0402s onto proper landing pads ;)

I already ordered the cable, so hopefully I won't have problems with whatever it is. I read somewhere that there are better drivers on the miklor.com site. Do those work with all cables, or should I just use whatever comes with my cable?

BTW, FWIW the RDA chip in my UV-5R is the RDA1846S. Does anyone know what the differences are between that one & the RDA1846? I downloaded the S datasheet & don't see anything different.

The only thing I could find was "RDA1846S add an new tail tone elimination function, when transmit and receive signal between 50Hz with 55Hz" on a dealer's Amazon page.

Both of my radios have the S so I don't know what the difference really is.

After my 2 Baofeng UV-82's I got a Kenwood TM-281a 65W mobile. It was about $142 brand new from Universal Radio or HRO. It's 2 meter only, but it's one heck of a nice easy to use mobile. I got it 2 months ago so hopefully prices haven't changed much.
It's not a Baofeng equivalent though. It has fast bank scanning, 65W max power, real 2 year warranty, It's easy to program and uses Chirp. But for a low cost rocking mobile it is very nice. With a Tram 1085 mag mount antenna I can hit repeaters 60 miles away.- Joe

The Kenwood should use the same cable as a Baofeng.
CHIRP also supports an IC-2100 or IC-2200.Both should be cheap on the used market andhave great rejection.

Good information there. TYVM sir. I'm using LMR-400 coax. As far as how it is terminated, hmm Screwed onto the antenna and radio? I bought it with fancy connectors and heat shrink installed already. It's 100' long which is way too much. About 40' is coiled outside. I'm using a goofy Redot 1050A digital SWR meter for my measurements. .

Subject: [Bulk] Re: [baofeng_uv5r] Antenna setup stuff. SWR? Forward power? I bolted a 10'5" Diamond F22A to my chimney for 2 Meters. http://www.eham.net/reviews/detail/4129 It's up at like 26' to it's base. This is a test install. You Elmers help me test it:) Ok, seems to be a reasonable sort of Omni. It's 1.5:1 SWR, 17.5 forward power, 7.0 reverse power. This is with my mobile Kenwood 281A on low 25W out. Will me grounding it help? It has no ground. More correctly it’s ‘DC Grounded’ but has radials so has its own ground plane – in short, probably not. I can live with the SWR but would like to get more than 17.5 forward at 25. 1.5:1 is a perfectly acceptable SWR, as a rule of thumb, anything under 2:1 is considered to be alright for most purposes. We need a little more information – for instance, what type of coax is it, how is it terminated and how long is the coax run? Additionally, you are stating 17.5 (presumably watts) Forward Power v 7 watts of reverse (presumably reflected) power which appears excessive. As I understand it, a VSWR of 1.5:1 would give reflected power of around 4% of transmitter output power, which based on 25w out of the TX would be more like 1w reflected power, so I’m not sure how you are coming up with 7w of reflected power at 25w out of the TX. If that’s the case, it would imply a VSWR of about 3.5:1 since reflected power at that ratio is about 30.9% of transmitted power – about 7.725w at 3.5:1 assuming 25w out of the TX. Have a look at http://www.antenna-theory.com/definitions/vswr.php in particular the table about halfway down the page. I think you may be trying to fix something that really isn’t broken and you need to remember that the transmission line is a major part of the equation, not just the antenna, but in this case, I think you have simply got the numbers wildly wrong somewhere... .:(TYVM for any help. I can't find an Elmer. Seem to be 1 or 200 on here. Hope this helps. GeoffVK5GDR

Too bad the 440 equivalent (TM-481) is unobtainium in the U.S. Sure you
can buy one on eBay but the exporters must know we can't get it here &
charge accordingly :(

A) Bob, there are currently 6 sellers offering the TM-481A units on E-Bay, and
B) Scott, I can assure you that none of the TM- series of Kenwood mobile radios use the same programming cable as a Baofeng HT.

>just to be sure.

Thanks. Yes I noticed that, in particular the final output transistor. However, in this case the "R25" looks up to an actual BJT.

Still, the 2N2222 SPICE model must be way different than this thing: a 10 pF between base & collector showed only 3 dB or so drop in SPICE, but the actual sensitivity is 0.6 uV for 12 dB SINAD (before the mod it was 0.13 uV). But even at that poor sensitivity I can hear my repeater whereas before it was being desensed by nearby transmitters. Will probably try a 4.7 pF next week.

Hi Joe,
I used to do a lot of antenna testing and I found out a few things you may
want to consider.
1. A dual band will have some losses on one band so I always carry a good
antenna for each band.
2. Also the way I test my HT's is to get another ham to work with you and
see what antennas work the best and give the best range on simplex.
Using a field strength meter also helps.
I work a local ham 8.2 miles and we both run 5 watts and better quality
duck type antennas.
One time a ham was mobile and he had a single band 58th mag mount.
We hot close to 20 miles and I had the duck antenna and he ad the antenna
I built for him.
You cannot expect any antenna to be resonate from 137 to 520Mhz.
I been reading the mail and you guy put in a lot of work getting software
to work.
Also I don't think a $30.00 dual band has the best receiver.
Find the antenna that works the best and hang a 19 inch counterpoise wire
on it.
Doing that here I see the needle goes up of the field strength meter.
BOB AF2Q http://www.aesham.com/antennas-handheld/

I really wanted to go to the Palm Springs, CA hamfest this weekend, but those guys moved the event from the same weekend as Quartzfest (which meant we were already halfway there) to this weekend (which screws up traveling to IWCE for vendor meetings on Sunday with Motorola). Oh well, maybe next year .....

Yes, already found that but thanks. It appears that the overload issues I observed were not due to mixing in those diodes, though I agree that there is no DC path to keep them from floating up close to their knee voltage. Maybe they're just very leaky & counting on that to keep them near zero bias.

The original thread was about a comment in the back of the Anytone TERMN8R owners manual.

But now that the Baofeng Tech "big announcement" is over and it is now known to be about another brand of radios altogether, any further discussion about it should be off topic for this Baofeng UV-5R group.

Hello All,

I have plenty of UV-5R radios and it just dawned on me I can use one of them for a fox hunting kit. I have the radio, I need a kit that needs minimal assembly to make an antenna and a carrier for the radio.

Thanks for any ideas.

Doesn't matter. If you have a Prolific type chip and running Windows, downgrade the driver to v3.2.0.0 (Windows Vista, 7, 8, 8.1 & 10) or v2.0.2.1 (Windows XP) following the instructions on the Miklor website.

You download it. I know, it is easy to say, 'use ver so and so' and leave you to go find it. then 90% of the time that ver doesn't work either. Been there, done that. I too have various models of the PL2303 that will not work with new, old, in between drivers. So I saved, with instructions, the one that DOES work for me.
You may download it from my box account if you wish:
pl2303 WORKS _prolific_gps_allinone_1013.zip - File Shared from Box

pl2303 WORKS _prolific_gps_allinone_1013.zip |
| |
| View on app.box.com | Preview by Yahoo |
| |
| |

enjoy.
PS: realize that once you make it work, it only works in THAT USB port - each usb port loads its own drivers, so plug into another port and it won't work. realize also that 1-2 times a year something will happen and the driver will get updated to one that does not work, so you will need to replace the file as described simply in the instructiuons included to get going again. These two items often cause confusion that make folks think a certain drive is no good when it really is.....

works well with the uv5? But I read many reviews that said the uv5's software radio made it unsuitable for fox hunting with active antennas that include the oscillator offset due to something or other? too poor selectivity? something? Who is right?
and without an S meter, how the heck is one to use a uv5 for fox hunting if the active tone antenna mixer is no good with it?
I just built my tape measure 3 ele beam to use with my older uv3 - since it has a live S meter. Just received my 3 power level toned 440mhz (adjustable) $ 20 'fox' to stick inside my phantom drone - just in case.... Will be testing how well it works soon....

Nobody was left to go find it. The link for the Miklor website which contains the links for the hosted drivers _and_ instructions for how to instal it were provided in an earlier post.

Your driver, v3.3.2.105 is the latest driver that will work with the counterfeit chips. If that was the only requirement, I would endorse it wholeheartedly. But that isn't the only requirement. This is a Baofeng UV-5R group. The driver needs to also work with the Baofeng software. To be compatible with all of the Baofeng software requires that the v3.2.0.0 driver be used.

You don't have to go to the trouble to uninstall all of the drivers like you show. They live fine together. You just have to follow the instructions and choose the one that you want to use. Now that I just installed yours (to verify the version), I have 3 drivers installed and I can switch between them at will. The "secret" is to choose the driver that you want to use (as shown in the instructions) and not just hope the right one will be magically chosen for your.

And since I have 2 USB ports on the front of my computer, I have configured both to use the same (v3.2.0.0) driver and set both to be assigned the same com port number. I can use either one as I please without having to adjust any software.

49200. My experience with a genuine FTDI cable

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-15 16:06:58 UTC
From: Skip
Topic: 49200 Message: 49200

After being inactive for several years, I purchased UV-5R at the Frostfest in Richmond this year. 2 or 3 Hams at the counter (outside) said that it was a great little radio for the price.

After determining that the supplied manual left a lot to be desired, I went online looking for info. Found lots of helpful info and wound up ordering a cable from Baofeng Tech, as I had read that many of the knock-offs did not work. Could not get the cable to "talk" to the UV-5R. Even sent it back to the seller to examine. They could not find any problem.

I tried 3.2.0.0 driver and guess what? As soon as I plugged the cable in, I would get the Blue Screen of Death. I'm running up-to-date Win 7 32 bit, so it should have worked. Booting up in Safe Mode, I got no BSOD, but still no communication with the UV-5R. So, after trying to determine what there was a conflict with, I gave up and I went to http://www.ftdichip.com/pccable (on sticker that was on the driver disk that came with cable), went to the driver download page http://www.ftdichip.com/Drivers/VCP.htm and downloaded and installed that driver. BINGO!!! Worked first time and has worked every time since. It's a FTDI 2.12.0.0 driver dated 8/26/2014 and Windows does not try to replace it with a newer driver.

One thing I have discovered, that no one seems to empathize, is that when manually (field) programming, it is best to start with an empty channel. Eliminates foul language when it does not work right.

Booting up in Safe Mode, I got no BSOD, but still no communication with the UV-5R. So, after trying to determine what there was a conflict with, I gave up and I went to http://www.ftdichip.com/pccable (on sticker that was on the driver disk that came with cable), went to the driver download page http://www.ftdichip.com/Drivers/VCP.htm and downloaded and installed that driver. BINGO!!! Worked first time and has worked every time since. It’s a FTDI 2.12.0.0 driver dated 8/26/2014 and Windows does not try to replace it with a newer driver.

One thing I have discovered, that no one seems to empathize, is that when manually (field) programming, it is best to start with an empty channel. Eliminates foul language when it does not work right.

Since you trust Windows 8 for your radio advice, might I suggest visiting the Microsoft Answers Forum instead of insulting the people here by totally dismissing their advice and refusing to read the FAQ, help files, and expanded user manual that people here have provided for you.

Of course, you don't really need anything special, just use body shielding.

I fail to understand why would have even bothered with the v3.2.0.0 driver. It is for Prolific type chips. The programming cable from Baofeng Tech has an FTDI chip, and as you found out, requires the FTDI driver. It should have been automatically installed by Windows 7.

Just for G&Gs, I put my RS scanner cable inmy other WIN7x86 box, which has an FTDI chip in it. It did not find a preconfigured driverbut did download and install one.
FTDI is fully supported by WIN7 at least in 32 bits.I don't remember what I did on this PC running x86but think I went to FTDI and downloaded a driver.
All my fake Prolific has been working fine sinceI installed that 3.2.0.0 driver from my CAT cable.That's the one I stuck in the files section withfiles dated from 2007.

Follow the step-by-step at http://www.miklor.com http://www.miklor.com/ .

Don't skip a step. You don't save an offset in the
UV-5R, you store a transmit and a receive frequency
into a memory location. Look into getting a programming
cable and try CHIRP. Lots more stuff to program then
is available from the keypad including scan skip.

Date: 2015-03-16 20:01:13 UTC
From: donhinklejr@...
Topic: 49219 Message: 49219

I have a couple of questions:

1) When scanning in freq mode, is there a way to lock a channel out so it won't keep stopping the scan and getting stuck on that same channel, that usually has some interference or clicking, or what appears to sound like constant mic keying on it?

2) Is there way to continuously scan (until I stop it)? It seems that mine will scan for some time, than just stop scanning and I have to press "scan" again. OI have to keep doing this as long as I'm listening, every 15 minutes or so. Annoying!!!

I have a UV-5R2

Thanks!!!

Your question is confusing. You ask about frequency mode but you say
channels. There are no channels in frequency mode.

There is no way to lock out frequencies in frequency mode. Scanning
scans between the band limits at the spacing set by STEP.

In channel mode, channels can be locked out from scanning but it
requires software to manipulate the "scan_add" bit.

The are three scan revive modes controlled by menu 18 (SC-REV).

TO: Time Operation - scanning will resume after a fixed time has passed

CO: Carrier Operation - scanning will resume after the active signal disappears

SE: Search Operation - scanning will not resume

I have mine set to CO and have never had an issue with scanning
channels. Scanning in frequency mode can be problematic because is
seems to receive a lot of spurious noise. I haven't tried to can the
VFO after doing the squelch mode to see if that is affected or not.

Topic: 9440 Message: 49221

The others beat me to it but they are right - the charger light will tell you when it's done by turning green..

As an extra,,
I have 4 different power sources for my 5R's. Here's what they are and how much life I get from each on average (receive only mind you)...
1. Standard 1800ma battery - 19-20 hrs
2. Standard 3800ma battery - 40-42 hrs
3. 6x AA Sanyo Eneloop NiMH 2550ma in a battery holder pack - 26-28 hrs
4. 6x AA Sanyo 2700ma (non Eneloop) NiMH in a battery holder pack - 30-32 hrs

To get these numbers, I turned the 5R on and left it sitting there receiving for about 12 - 14 hours each day, then tuned off until next day. Amount of traffic makes no real difference to the results. The only thing I've done in the setup is turned off the back lighting in the display...

I'm guessing a bit here, but it seems that he is scanning in frequency mode
(something that is pretty rare). Given the slow scan rate of these radios,
his "15 minutes or so" sounds like the radio might have finished scanning
the frequency range. Has anyone ever actually waited for this thing to
finish scanning a band in frequency mode to see if it restarts at the
beginning again (like most ham radios) or perhaps it just gets to the end of
the band and stops??

I have a hard time imaging why anyone would waste time scanning with one of these radios at all -- and especially in frequency mode -- but it does seem that people buy these radios with very strange expectations.

I got an early review sample of the BF-F9 V2+ and it's pretty much functionally identical to the earlier models; the main difference is the higher power range it shares with the F8HPO- although I'd be very careful about duty cycle running that tiny radio at 8 watts. Mine also came with an official Baofeng programming cord, but I haven't found an OS X driver that works with it yet.

I'm not sure about everyone that owns one of these radios, so I can only speak for myself.

I live in such a dead area that there's nothing here (rural area). No repeaters and none of the freqs on-line seem to apply to this area. The only way to find anything at all is by scanning and listening for chatter. That's how I have to find activity.

I've never actually watched it run through a scan cycle, I'm always off doing other things when I set it to scan. Now that you mention it, I do suspect that it probably comes to the end of the freq range and probably just stops.

True, it is slow, slow, slow! If I start at power on, it can seem to take forever!

I 'm new to all of this, so please be kind. Remember: You were once a newbie too!!!

I'm guessing a bit here, but it seems that he is scanning in frequency mode (something that is pretty rare). Given the slow scan rate of these radios, his "15 minutes or so" sounds like the radio might have finished scanning the frequency range. Has anyone ever actually waited for this thing to finish scanning a band in frequency mode to see if it restarts at the beginning again (like most ham radios) or perhaps it just gets to the end of the band and stops??

I have a hard time imaging why anyone would waste time scanning with one of these radios at all -- and especially in frequency mode -- but it does seem that people buy these radios with very strange expectations.

49225. UV-5RTP

Does anyone have the 8w UV-5RTP yet? Mine should arrive Wednesday.

I hope to open the frequency range up with the stock software, and try CHIRP to do the rest of the programming.

Has anyone heard of or used CHIRP with the UV-5RTP? The last info I found was that there is no current CHIRP build that will work with it.

Scanning in Freq mode loops I set it near the edge and it started back at the beginning and continued and
you can only skip channels in scan mode.

I didn't intend to criticize, but scanning at all with these radios is fairly rare (after a few attempts most people realize that it just isn't much of a scanner) and as Jim mentioned scanning in Frequency Mode is exceptionally rare -- I suspect that is why no one has ever noticed whether the radio stops at then end of a frequency scan or loops back to start again.

You may well be the first person to actually let if finish scanning either band.

I won't try to tell you that there must be some repeater or other radio traffic in your area because I am sure that there really are a few places in the absolute middle-of-nowhere with no significant coverage, but I will say that such places are awfully rare in the US. On the other hand, just because there is a repeater with coverage into your area does not mean that you can simply tune a radio to the proper frequency and expect to hear people talking 24/7. The vast majority of ham repeaters have well under 10% utilization - even in "crowded" areas. Most ham repeaters have a small number of regular users who use the repeater on a fairly regular schedule - such as weekday morning drive-time. The rest of the time there may be several people who have a radio turned to the frequency, but they probably aren't saying anything - and, as many new hams have found out, even getting on an open repeater frequency and announcing your call typically won't get a response unless you specifically ask for some reply (and often not even then).

You didn't mention where your particular middle-of-nowhere is located, so we can't offer any more specific suggestions on what you might be able to listen to in your area. Without a ham license I'm afraid that you won't get much active use from one of these radios.

I'm not sure about everyone that owns one of these radios, so I can only speak for myself.

I live in such a dead area that there's nothing here (rural area). No repeaters and none of the freqs on-line seem to apply to this area. The only way to find anything at all is by scanning and listening for chatter. That's how I have to find activity.

I've never actually watched it run through a scan cycle, I'm always off doing other things when I set it to scan. Now that you mention it, I do

suspect that it probably comes to the end of the freq range and probably just stops.

True, it is slow, slow, slow! If I start at power on, it can seem to take forever!

I 'm new to all of this, so please be kind. Remember: You were once a newbie too!!!

Except for presetting a few work mode settings, there isn't anything
the "stock" software can do that CHIRP can't. I'm curious. What is it
that you think the "stock" software can do that CHIRP can't?

The UV-5R TP was supported by CHIRP (using the BF-F8HP model
selection) even before it available. Here is what the "Supported
Radio" list on the CHIRP home page shows.

BF-F8HP (in daily builds)
Also includes the BF-F9V2+
Also includes the GT-3TP
Also includes the UV-5R TP

Thanks, Jim!

I have never used the Baofeng software, only CHIRP. Putting my current channel collection into my new radio in just a few steps sounds great.

I didn't know where to look for the CHIRP for the RTP, but now I do.

Thanks again,
Tom P.

I have a 5RTP...

I have only used chirp to program it, because the factory software doesn't work to change the "other" settings. In chirp I can change the welcome screen, the frequency range, etc etc etc that u can't change in the factory software. For some strange reason the F8HP and later models including the F8+ won't let u change any of those "other" settings.

The 5RTP though doesn't seem to work as well as my F8HP though, but it is on par with the original UV5R.

Oh yeah... Another thing I've noticed is the 5RTP tends to warm up faster than my F8HP. But I still use the 5RTP for a beater radio. And use the V85 antenna. It works really well with that radio. The stock one yer getting, is not very good and the radio kinda heats up even quicker.

FWIW, the UV-B5 scans faster than the UV-5R: about 6 steps per second. You can also change the scan direction while scanning on the B5 by pressing the up & down buttons.

Baofeng generally has two versions of software for these radios, CPS and VIP. The VIP software has the "Other" menu. I have never seen the VIP software for the radios with 3 power levels. As far as I know, the CPS software doesn't let you program the 3 power levels, either.

The only real difference between the BF-F8HP (which could stand for Higher Price) and the BF-F9V2+ is the antenna. The F8HP comes standard with the more expensive (by about $3.00) antenna while the F9V2 comes with the standard crummy antenna (but with the money you save you still come out ahead even if you buy the F9V2 and an extra antenna.

Yes, the F8HP comes with a better manual (virtually a clone of the Chinese radio manual available at Miklor for free with some minor changes), but the F9V2 has a front metal faceplate (whereas the F8HP has a thin plastic sleeve over the speaker) and it's FCC Part 90 certified (and the BF-F8HP isn't).

In terms of real world use, so long as equipped with the same antenna, I can't see much difference between the two in terms of performance to justify the higher price of the BF-F8HP unit.

From: Joe
Topic: 49239 Message: 49253

I have never seen one. But I've talked to a couple on local 2M and both of them had horrible audio at 8 Watts, but when they turned it back to 4? Watts they sounded great. I suggested that with Baofeng's reputation of selling the same old stuff with a new spin, maybe their 8 watt was just 4-5 watt hardware cranked up beyond it's limits. Does anyone know if the finals or whatever in the 8W Baofengs are actually beefier, or is it the same hardware pushed past it's limits?

In the radios I have seen new the alarm is configured by default to transmit the alarm (tone) on the selected channel, so that is one thing to consider in this test.

They all come from the factory this way. One of the first things a new radio owner should do is change menu 32 (ALarm-MODE) to SITE to avoid transmitting the "alarm" over-the-air.

49263. Chirp .csv vs .chirp files programming UV5R

Yahoo group: baofeng_uv5r (2015)

From: cprendon@...
Topic: 49263 Message: 49263

When exporting a/multiple memory configuration(s) in Chirp you can select either a .csv or .chirp file format. I do not find anything that describes any difference or preference of one over the other unless you are going to edit externally. The only experience I have had to show a difference in just copying is that I cannot export a memory channel where the Duplex is set to "off" as with a weather channel. I can export such channels as .csv files but when exporting to a .chirp format the row is unchecked and you cannot check it. By process of elimination I have found that the setting that blocks exporting into .chirp is the Duplex = off.

Has anyone found any other functional differences between the two file formats when just copying? Just wondering if there is a reason to choose one over the other when just exporting from one Chirp radio image to another as in different firmware same model or one model to different model radio channel copying.

I been reading the mail guys and it looks like you just my invent a better HT maybe called the Yahoo VR+?::-)
I'm on my 3rd day trying to put in a 1 meg split in my FT 256 HT.
What a piece of junk that is.
I'm thinking of getting the UV5RV3+

Chirp export function is broken for both the .csv and .chirp formats. It
won't copy all the memory editor columns or locations if you try to
export memories with split tones.

When exporting to .csv it partially works but there is no DTC Rx Code
column.
When exporting to .chrip any memory with split tones is greyed out.

I haven't determined if there are other differences.

From: Aristotle Zoulas
Topic: 49268 Message: 49268

Hello gents, I am new to the group, what is the newest UV-5R? Per the baofengtech.com web site, the BF-F9 V2 + is a scam and should be avoided. Is baofengtech.com the real Baofeng web site or is this a scam to cover up another scam? Too many fakes out there. Also, what is the recommended seller to buy from? I am seeing from the reviews that many people are getting used ones from Amazon--radios that come with frequencies programmed in to the radio.Thanks for the input.

Hi all. I just bought a Baofeng UV-TEN4 on Ebay but I don't know where to find the program for it.

Has anyone tried this model?

Any clues?

This just looks like one more of the many UV-5R variants. The UV-5R software will likely work. Go to miklor.com, get the Baofeng or CHIRP software and try it.

Thanks Jim, I tried the newest and two older UV5 programs as well as the UVB5 and 6, UV82 and Chirp. No handshake with the radio.

I'm hoping I'm not the only guy who bought one... lol

There is no reason to export to a .CSV or .CHIRP file when you want to move channels from one radio type to another. You can directly "import" the native .IMG file in to the current tab.

Jim KC9HI

The .CHIRP format shouldn't be used. It was discussion recently about removing it.

Baofeng Tech is simply another seller of Baofeng radio products, so their claim that any other Baofeng radio (that they don't sell) is "a scam" should be considered for what it's really worth (not much).

That is cool!!! I didn't see that anywhere on the Chirp site. Thanks.

I've been here a few months and haven't seen anything about not using the .chirp format. Is there a problem with it? I don't see a topic on this and of course searching ".chirp" yields thousands of results.

There is almost nothing about the Baofeng UV-5R V2+ and even the U tubes are gone.
Now i'm considering the Baofeng UV-5R V3+.
Has any one here have any luck getting it to program manually?
The 2+ I have has the shiny metal wire speaker grill and I no longer see that on Amazon.
The very small Baofeng UV-5R V3+. is no longer shown on amazon and that U tube now is gone.
Any suggestions?
Amazon told me their back ordered and they don't know when the next batch will be in.
Appreciate any suggestions.
Thanks.

From: w8jvf@...
Topic: 49287 Message: 49287

Just in case anyone is thinking of purchasing one of the new AnyTone radios from BFTech/ATTech and you've see all the technical wonders of these radios... Here's a non-technical review I posted in the Anytone 8R group...

Hope this helps...

So I've had this little gem of a radio now for about a week, and I have to say, it's not all that bad. There's been a LOT of technical reviews done on this radio and its series, but putting the technical aside I have to say I'm questioning my spending of $140.00 for this radio. Let me start off by pointing out the positives, then I'll get to the negatives.

Multi-Function "boot"...

Don't know how else to describe it. Basically you can boot this radio into a few different modes, Normal, GMRS, or MURS. If you have a mixed family (hams and non-hams) or have a GMRS license this would be an excellent tool. Also, if you find yourself in a group (say on a backpacking/camping/hiking type of trip) of mixed raios, you could conceivably talk to everyone in the group. Theoretically. So it is a pretty decent feature.

Scanning Speed....

HUGE improvement over the other chinese radios. If you have over 6 frequencies to scann, you're gonna want that faster scanning speed.

Weather protection...

So it's advertised to have some weather protection, which is there if using all stock equipment. The minute you throw on a speaker mic or a non-stock antenna that weather protection is gone. But usually if you're like me, the reason you're using a speaker mic is because you have the radio protected under your jacket so for me it's not that big a deal. What is a big deal is I can throw this thing in my pack, and if I fall in the mud or the heavens open up it's got a chance of still working.

Antenna...

Yeah... the antenna is a plus. It WORKS... I mean it's got really good receive and seems to hit everything I talk to and on, and doesn't look that bad either. Yes, aesthetics is something people DO look at for a radio.

And now the new feature I like the BEST.... NOAA weather alert.

I like having a radio, and I like having weather alert. I DON'T like carrying around two radios. It's nice to have everything you need in one little package, but not overbearing with all kinds of distractions like a mobile phone. I'm thinking because of the dual receive and the crossbanding, there is a distinct possibility that if transmitting on UHF, the NOAA alert will still go off if you have the menu set right. Looks like I'll have to wait until the first Monday to check it out.

Charging in the car...

NICE... Charging in the car directly to the battery with a cable that has the proper voltage and amps. Just plug it in, plug it into the battery, and BAM... it's good to go. I only wish there was a AC adapter which charged directly into the battery.

OK... Now I have to point out the cons....

Cross-Band Repeater...

Why do people use cross band repeater? Well, from what I've found there's a lot of people that use cross band repeating in one direction. From INSIDE their house to the crossbanding radio then to the repeater they are rag chewing on. They're able to HEAR the repeater, but with a lot of the newer construction wrapping houses in tin foil it's like living in a faraday cage at times. This radio only does TWO way crossband. Really wish there was a way to adjust this. Talk about a radio getting HOT on a rag chew session LOL. I hope this is able to be changed in future firmware upgrades, because without this change the crossband function is really sort of useless to me. (here's where the comments come out about crossbanding is useless anyway) Also, the way to start the crossbanding is a little tricky with the buttons to hold down while turning on the radio.

Battery life...

Average. Don't expect to rag chew all day and/or scan and expect the battery to last more than 6-7 hours. If you're just monitoring and talking occasionally then you're gonna get about 12-14 hours of continuous on. An extended battery would be real nice, but the case design doesn't lend itself to an extended battery.

HF receive....

Ok... so on paper the SW and LW (basically 1.5-30mhz) looks good and seems like a nice feature. There's only one problem. It's AM only, no SSB receive, and there's a HUGE issue with capture with the antenna. Basically there's not enough antenna to catch a good signal. I can barely pick up the "time station" (10.0, 5.0, and 2.5mhz on AM) with this radio. The same thing BOOMS in S-9++ on my FT-857 with long wire, but is burried in noise and static on the TERMN-8R. So basically the HF receive is kinda useless in my humble opinion. Maybe others have had better luck, but it just doesn't seem to have any use for me.

Functional QSO compared to other radios...

Compared to the Wouxun KG-UV8D ($109.00 firmware 1.05) and the Baofeng BF-F8HP ($63.00 + $20.00 extended battery + $10.00 extended faux leather case = $93.00 and the latest firmware from BaofengTech) I'm not sure the extra $30.00 on this radio is worth it. The UV8D is so SOOO easy to switch to repeater, changed channels on the repeater when in repeater mode, and read the screen that it's hard NOT to use it once you go through the menus a few times. Just wish there was a proper case or a screen protector for that screen. For straight QSO's, the Baofeng works like a champ. It's not pretty, not expensive, and isn't feature packed but so far it's built like a tank when I put the extended case on it. Plus, I program all my channels with medium power, then switch to the high power if needed. With extended battery is kicks the AnyTone's butt on battery life.

Bottom Line...

Unless there's a firmware upgrade to work out some of the issues I find as issues, I doubt I would buy another one. Other than the NOAA weather alert I just can't seem to bring myself to shell out the extra 30-40 over the cost of my Baofeng to do all the same things that I normally do with a radio. Also, yes... it is possible to lock out transmit on the NOAA weather channels if you want to monitor them on the Baofeng.

Hopes this helps anyone looking to purchase one!!!! It's nice, but I doubt I will use it to its full potential.

I got my new UV5-RTP. FV BFP3-25

The cable I got from wouxun.us over a year ago has never worked on Windows 8 no matter what driver I install. I saved my old XP desktop machine just for programming my old UV-5R. The cable for my Anytone 5888UV works fine on Windows 8, but that's another story.

I hooked my XP machine up and plugged my new UV5-RTP into it. Could not find any Baofeng or CHIRP software to work on it. Just for encouragement, I tried an old CHIRP build that works on my UV-5R. The UV5-RTP responded, and the program said it was reading the radio, but I just got a blank screen.

Does anybody have any links to software that works in the UV5-RTP with FV BFP3-25? Maybe I need a different cable, maybe there is no software for this version yet. For now, it just goes back in the box and into storage because I haven't been able to make it work.

While I have my XP machine out, I might as well delete and add some channels to my old UV-5R, which still works fine.

Subject: [baofeng_uv5r] Just in case....

Just in case anyone is thinking of purchasing one of the new AnyTone radios from BFTech/ATTech and you've see all the technical wonders of these radios... Here's a non-technical review I posted in the Anytone 8R group...

Hope this helps...

So I've had this little gem of a radio now for about a week, and I have to say, it's not all that bad. There's been a LOT of technical reviews done on this radio and its series, but putting the technical aside I have to say I'm questioning my spending of $140.00 for this radio. Let me start off by pointing out the positives, then I'll get to the negatives.

Multi-Function "boot"...

Don't know how else to describe it. Basically you can boot this radio into a few different modes, Normal, GMRS, or MURS. If you have a mixed family (hams and non-hams) or have a GMRS license this would be an excellent tool. Also, if you find yourself in a group (say on a backpacking/camping/hiking type of trip) of mixed raios, you could conceivably talk to everyone in the group. Theoretically. So it is a pretty decent feature.

Scanning Speed....

HUGE improvement over the other chinese radios. If you have over 6 frequencies to scann, you're gonna want that faster scanning speed.

Weather protection...

So it's advertised to have some weather protection, which is there if using all stock equipment. The minute you throw on a speaker mic or a non-stock antenna that weather protection is gone. But usually if you're like me, the reason you're using a speaker mic is because you have the radio protected under your jacket so for me it's not that big a deal. What is a big deal is I can throw this thing in my pack, and if I f all in the mud or the heavens open up it's got a chance of still working.

Antenna...

Yeah... the antenna is a plus. It WORKS... I mean it's got really good receive and seems to hit everything I talk to and on, and doesn't look that bad either. Yes, aesthetics is something people DO look at for a radio.

And now the new feature I like the BEST.... NOAA weather alert.

I like having a radio, and I like having weather alert. I DON'T like carrying around two radios. It's nice to have everything you need in one little package, but not overbearing with all kinds of distractions like a mobile phone. I'm thinking because of the dual receive and the crossbanding, there is a distinct possibility that if transmitting on UHF, the NOAA alert will still go off if you have the menu set right. Looks like I'll have to wait until the first Monday to check it out. &n bsp;

Charging in the car...

NICE... Charging in the car directly to the battery with a cable that has the proper voltage and amps. Just plug it in, plug it into the battery, and BAM... it's good to go. I only wish there was a AC adapter which charged directly into the battery.

OK... Now I have to point out the cons....

Cross-Band Repeater...

Why do people use cross band repeater? Well, from what I've found there's a lot of people that use cross band repeating in one direction. From INSIDE their house to the crossbanding radio then to the repeater they are rag chewing on. They're able to HEAR the repeater, but with a lot of the newer construction wrapping houses in tin foil it's like living in a faraday cage at times. This radio only does TWO way crossband. Really wish there was a way to adjust this. Talk about a radio getting HOT on a rag chew session LOL. I hope this is able to be changed in future firmware upgrades, because without this change the crossband function is really sort of useless to me. (here's where the comments come out about crossbanding is useless anyway) Also, the way to start the crossbanding is a little tricky with the buttons to hold down while turning on the radio.

Battery life...

Average. Don't expect to rag chew all day and/or scan and expect the battery to last more than 6-7 hours. If you're just monitoring and talking occasionally then you're gonna get about 12-14 hours of continuous on. An extended battery would be real nice, but the case design doesn't lend itself to an extended battery.

HF receive....

Ok... so on paper the SW and LW (basically 1.5-30mhz) looks good and seems like a nice feature. There's only one pro blem. It's AM only, no SSB receive, and there's a HUGE issue with capture with the antenna. Basically there's not enough antenna to catch a good signal. I can barely pick up the "time station" (10.0, 5.0, and 2.5mhz on AM) with this radio. The same thing BOOMS in S-9++ on my FT-857 with long wire, but is burried in noise and static on the TERMN-8R. So basically the HF receive is kinda useless in my humble opinion. Maybe others have had better luck, but it just doesn't seem to have any use for me.

Functional QSO compared to other radios...

Compared to the Wouxun KG-UV8D ($109.00 firmware 1.05) and the Baofeng BF-F8HP ($63.00 + $20.00 extended battery + $10.00 extended faux leather case = $93.00 and the latest firmware from BaofengTech) I'm not sure the extra $30.00 on this radio is worth it. The UV8D is so SOOO easy to switch to repeater, changed channels on the repeater when in r epeater mode, and read the screen that it's hard NOT to use it once you go through the menus a few times. Just wish there was a proper case or a screen protector for that screen. For straight QSO's, the Baofeng works like a champ. It's not pretty, not expensive, and

isn't feature packed but so far it's built like a tank when I put the extended case on it. Plus, I program all my channels with medium power, then switch to the high power if needed. With extended battery is kicks the AnyTone's butt on battery life.

Bottom Line...

Unless there's a firmware upgrade to work out some of the issues I find as issues, I doubt I would buy another one. Other than the NOAA weather alert I just can't seem to bring myself to shell out the extra 30-40 over the cost of my Baofeng to do all the same things that I normally do with a radio. Also, yes... it is possible to lock out tra nsmit on the NOAA weather channels if you want to monitor them on the Baofeng.

Hopes this helps anyone looking to purchase one!!!! It's nice, but I doubt I will use it to its full potential.

I think that I should point pout that "tech wise" (power, transmit, audio, etc etc) works just fine. In fact actually pretty good. It's just the other features need "honed" and the radio would be a home run for 140.00.

It really feels like a nice solid well built radio. It's just some of the native programming in the unit.

The ability to NOT put the crossband repeater on direct or one way repeat is a huge issue for me. BUT I do have my UV8D hooked up to do the job, so I can't complain too much. I just wanted to have a second radio to do this.

Oh well, maybe they can change it in the firmware upgrades.

A UV-5R is a UV-5R no matter what letters or numbers a seller chooses to hang off the end of the model number.

The only difference between these radios are cosmetic differences in the case.

A UV-5R is a UV-5R no matter what letters or numbers a seller chooses to hang off the end of the model number.

Any seller can get this radio with any model number he wants simply by placing a large order and paying a small extra charge.

A UV-5R is a UV-5R no matter what letters or numbers a seller chooses to hang off the end of the model number.

When a seller orders a batch of radios with a special label, he can also get BaoFeng to contract not to sell radios with that same model number to anyone else for a year. This is why some dealers can talk about their "exclusive" model radio -- because everyone else is selling the exact same radio with a different label on it.

A UV-5R is a UV-5R no matter what letters or numbers a seller chooses to hang off the end of the model number.

The "very small Baofeng UV-5R V3+" is exactly the same size as every other BaoFeng UV-5R -- because it is exactly the same radio.

A UV-5R is a UV-5R no matter what letters or numbers a seller chooses to hang off the end of the model number.

The UV-5R V3+ is readily available on Amazon.

And, one final explanation: A UV-5R is a UV-5R no matter what letters or numbers a seller chooses to hang off the end of the model number.

There is almost nothing about the Baofeng UV-5R V2+ and even the U tubes are gone.
Now i'm considering the Baofeng UV-5R V3+.
Has any one here have any luck getting it to program manually?
The 2+ I have has the shiny metal wire speaker grill and I no longer see that on Amazon.
The very small Baofeng UV-5R V3+. is no longer shown on amazon and that U

tube now is gone.
Any suggestions?
Amazon told me their back ordered and they don't know when the next batch will be in.
Appreciate any suggestions.
Thanks.

Not to argue the value of "cross band repeat" in any of its flavors one way or the other, but considering how rarely cross band repeat makes any sense at all USING AN HT this isn't a problem that most people should be overly concerned about. (Of course there are probably more people using cross band repeat than have any good reason anyway, and only a small number of them have any idea what it is or does).

Yeah, but what about next weeks model? Perhaps UV-R5 rv031815 or some such scheme? That way some shyster could come up with a new model every week!

Yes you can get one but the question remains.
Two HT's 3 weeks apart and from the same batch,but one has the older firmware and one has the newer firmware.
So because I kept fighting,I have a free 3+ coming and I also said that I want guarantee that this one will have the latest firmware
The V2+and V3+ have no band button so they are a bit different.

I seem to remember reading here somewhere that there is a new UV5R variant which is not compatible with Chirp software. A V3+ model or something like that. No?

You know, if you just take out those LNAs in front of the RDA1846 & put
some modest bandpass filtering in front of it, you would have a fairly
decent receiver. I've modified my UV-5R's front-end by putting a 4.7 pF
chip cap across the collector & base of the UHF LNA, & have been using it
in place of my mobile radio the past few days (plugged into my mobile
antenna). Been working great even in high RF locations.

Let me try explaining this by typing slowly...

Worrying about the "latest" firmware is NONSENSE! Each "new" firmware may be better or worse than the one before it -- usually each new firmware fixes some small flaw in the previous version and adds some new flaw (often a more serious one). NONE of the firmware changes in recent months have included any significant changes in functionality or in how the radios operate. If you do get the "latest" firmware, radios shipped tomorrow may well have "newer" firmware.

If you bought the radios on Amazon, from any seller using Fulfilled By Amazon, then you can't really know who provided the radios you received if there are any other sellers offering the "same" radio.

The BAND button has been unnecessary for many months -- its absence does not indicate any real difference in the radio inside the case. If you open the case and look at the circuit board, you will find where the band button would have been connected to the board. On the models that use a case with a hole for the band button, the factory installs the button to fill up the hole. On models that use a case without a hole for the band button the factory leaves off the button. Either way it is exactly the same circuit board inside the case.

Yes.I can attest that it works just fine so far.

And the old driver works too if you have a fake cable per the Miklor site.

49315. UV-5R-2 and BF-F8+

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-20 16:56:38 UTC
From: donhinklejr@...
Topic: 49315 Message: 49315

II'm a newbie to HAM radio so...

As a previous post said "they are all the same."

I started with a UV-5R-2 and decided to get a second one to keep in the vehicle. I went to Amazon to re-order but they are no longer avail. So I decided to "upgrade" and ordered a BF-F8+.

Firmware:
Both radios have the same firmware.

First impressions:
1) I love the "inverted" screen, when its on. When its off, it sucks! SUCKS! TOTALLY SUCKS!!!
2) The radio itself is exactly the same, as far as I can tell, except a couple of case differences, and of course the screen.
3) I did notice that the BF-F8+ seems to hold on to a weak signal a little better.
4) The BF-F*+'s manual is about 2x in size and formatted a little better. I can actually read it now! Better than everything jumbled together like the dinky 5R manual.
5) Both radios came with the exact dummy load antenna and accessories. Nothing new, nothing different. Still the same sucky ear piece, etc.

I cloned the R5 to the F8 with my freqs for testing purposes. I was unable to clone it directly (it kept giving me errors saying it wasn't compatible, or something to that effect. So I took the factory image I saved and just copied everything from old old to the new. That worked. The F8 scans the exact same speed (or lack of!) that the R5 does. No improvement there.

About only thing I did notice is the the F8 seems to hold weak signals a little better.

The buttons seem to be softer too. They aren't as hard on my manly fingers as the R5 is when you enter a lot of numbers.

Sadly, the "0" is still in the wrong place!!!

One final note. After inserting and removing the programming cable a couple of times the internal speaker on the R5 went out, just days after I got it. I was forced to buy a speaker mic for it, just to hear it! I've inserted/removed the cable a dozen or some times already (testing) on the F8 and the speaker still works!

Conclusion:
The same radio!!! Cosmetic differences.

Probably not. All UV-5R variants since the ones with BFB297 firmware all masquerade as BFB297 in the [3] key + Power-in message. The only exception to this is BFS313 firmware which reports BFS297. You have to use CHIRP to get the "real" firmware version.

Instructions and pictures won't do much good unless you have experience working with tiny SMT components.

Also remember that if you do any mods you void the FCC certification.

The Amateur Radio Service is covered under part 97 off the FCC rules.
I assume the above was a typo.

The problem with the "higher end" radios is that they lack other features such as split tone (independent TX & RX tones). I'd be happy with my VX-177 if it could do that, but it can't & Yaesu along with most of the other manufacturers don't seem to think it's important. Many Alinco radios can do it, but I'm not about to spend over $200 on a radio that will cost another $200 to repair if a firmware update bricks it.

IMO there's certainly nothing wrong with modifying these radios in order to make them work better. That's what amateur radio is all about.

>KB9OAU

OK, first reference the schematic at this link:
<http://www.radioscanner.ru/files/download/file14137/shema-baofeng-5r.pdf>.
The mod is a 4.7 pF capacitor between the collector & base of Q10.

I know, that doesn't tell you a whole lot in terms of just where to solder
that cap. I did manage to get a pic with my cellphone while it was open,
so here is a pic of the board with the chip cap installed:

<https://groups.yahoo.com/neo/groups/baofeng_uv5r/photos/albums/1045150706/lightbox/601375
658?orderBy=ordinal&sortOrder=asc&photoFilter=ALL#zax/601375658>

Q11 is identical in appearance & is above Q10 in that pic, so that gives
you a better idea of what you're soldering the 0805 cap to.

There are 2 side effects of this mod: receive sensitivity will be reduced:
mine went from 0.13 to 0.36 uV for 12 dB SINAD. However, when comparing
reception to my UV-B5 which checks out at 0.16 uV, I hear very little
difference in actual real-world reception.

After the mod, the squelch seemed very tight even when set to 1. It was
bad enough to be a deal-breaker for this mod, but fortunately the squelch
levels for every squelch setting from 1 to 9 are adjustable via the latest
build of CHIRP. So I bought a programming cable, downloaded the radio
image & took a look at the settings in the service menu of CHIRP. Squelch
setting 1 on the radio was set to level 17; I ended up taking it all the
way down to 0. Here are the UHF squelch levels I ended up using for the 9
squelch settings:

1: 0
2: 6
3: 9
4: 10
5: 12
6: 14
7: 16
8: 18
9: 20

BTW I didn't try this mod. on the VHF side (Q11) because I don't use 2 meters much, & have yet to experience any significant IMD or blocking when listening on that band. But if I were to try it, I'd start with a 10 or 15 pF cap across the collector & base of Q11.

& finally a note on reassembly: there are many good videos on YouTube that show you how to take these things apart. However, when you put it back together you need to make sure that the 2 tab slots on the LCD frame fit completely over the PC board tabs at the top of the board. If they just sort of rest on those tabs but don't slip over, everything will seem to go together fine but when you turn on the radio the LCD will only have part of 1 line working, or nothing at all. Take a good look at the top area of the LCD where those tabs are before pulling it apart to see how it should fit back together, & you should be fine. I've had mine apart over half a dozen times now with no problems aside from a broken speaker lead.

About the only time that I can think of where a user might find cross-band repeat a normal function (on a handheld) is for search and rescue work in rugged terrain. There may be others, and certainly cross-band is handy, but you are correct that "most" users don't need it in a handheld.

Subject: [baofeng_uv5r] GT 3 vs UV 5 X

Posting this question separate as it seems my other post has gone off another direction.

Are the gt3 and uv5x essential the same. Many thanks

They are using this function at the border areas here. Volunteers are watching the border to see what is coming across a few at the spotter hills are putting their radios in repeater mode if the hills are blocking the simplex ranges for the roving scouting parties.

The are using Zastone MP900 versions to do this with solar hookups but also Uv8D’s have been used. I supplied a few Renogy portable panels too.

I was asked to go down and assist in setting some of this up but someone else went and did it. Too bad DHS is basically incompetent under the current regime , or ranchers and property owners would not need to be doing this.

About the only time that I can think of where a user might find cross-band repeat a normal function (on a handheld) is for search and rescue work in rugged terrain. There may be others, and certainly cross-band is handy, but you are correct that "most" users don't need it in a handheld.

On Thu, Mar 19, 2015 at 11:32 AM, 'Xaun Loc' xaunloc@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Not to argue the value of "cross band repeat" in any of its flavors one way or the other, but considering how rarely cross band repeat makes any sense at all USING AN HT this isn't a problem that most people should be overly concerned about. (Of course there are probably more people using cross band repeat than have any good reason anyway, and only a small number of them have any idea what it is or does).

-----Original Message-----
From: w8jvf@... [baofeng_uv5r]

The ability to NOT put the crossband repeater on direct or one way repeat is a huge issue for me. BUT I do have my UV8D hooked up to do the job, so I can't complain too much. I just wanted to have a second radio to do this.

Oh well, maybe they can change it in the firmware upgrades.

Hey Jim,

I know you collect those factory images. I just posted the UV-5X image to the files here.

Can you send me an off list e-mail? I can't seem to figure out how to do it. Sorry for all the others that have to read this.

It isn't limited to a particular model or firmware. You buy your radio, you take you chances. So far the issue seems to be limited to the UV-5R variants. So get a UV-82 or one with 3 power levels.

Disregarding the political commentary and the advisability/inadvisability of the activity, I do see one technical question:

What is the life expectancy of these HTs used in cross-band repeater mode, especially at high ambient temperatures.

The Communications Act of 1934 and all of it's various Parts also require licensees to operate in accordance with the applicable rules. It is the responsibility of Part 90 licensees to comply with all aspects of Part 90. As a Part 90 license holder, it is my responsibility to only use COMPLIANT equipment. The certification is but one piece of information for me to determine whether or not a radio is compliant. It is entirely the responsibility of the license holder to determine what radio(s) can be used under their license. As a Part 90 license holder, I can tell my operators what radios they can, or cannot, use. The certification is but one piece of information available to me to help determine if a radio is suitable. The lack of certification clearly says a radio is not suitable. But the presence of certification does not, in and of itself, necessarily say a radio is suitable.

If I provide my users a non-compliant radio, it is my responsibility. If someone uses a non-compliant radio under my license without my knowledge or permission, it is their responsibility. Further, if anyone uses any radio under my license without my written permission, they are in violation of the FCC regulations. If I am an employer, and one of my employees uses a non-permitted radio, it could (and should) cost them their job.

One of the uv5R setups with two radios and a controller burned up one of the radios the LCD was burnt it got so hot. It was brought back and they asked if it could be fixed (chuckle) The uv8D got hot too but after they burned up the uv5R's they only used short direct pointed comms. So the uv8D was operated at low duty cycles and with long periods of inactivity. –after the uv5R lesson was learned.

The Zastone mobile was used more, but was set up on low power and had a 12v computer fan rig that pulled some of the heat away. So far did not have any problems.

Biggest prob was a bored control operator sitting up on a hill for long periods of time. (I was told)

The uv5R setup lasted half a day before burning up.

I think they said they had 25 people and were using quads on trails the roving quad group was the ones using the repeater to talk back to a base area and the hill spotters.

Bob,

I posted this before but will do it again in case you missed. I started dealing with the inexpensive Chinese radios a few years ago, just before they started becoming popular.

I have had hundreds of them come and go. I have seen all sorts of problems with them. At one time 1 out of 4 was coming from the factory and would not work out of the box. After being stung this way, I started looking at more upscale models. At our shows we will have at least 15 or more brought to the tables broken or inop with the owners wanting guidance.

What I have learned is this:

Try to buy from a home based dealer with support and a return policy- better yet buy from someone Face to Face- even if it costs slightly more.

Avoid the real low ball price sales seen online, there is often a reason for the radio to be sold below normal dealer or retail costs.

If the radio has the same shape or case, it is the same radio regardless of claims. They are the same boards in them except ones with updated chipsets which could offer better performance that some noticed and others saw no difference.

Some claim they bought radios off Amazon that looked like they were returned and then repackaged or did not work and looked like they were not new. Buyers beware.

I would stay away from the uv5R’s and either get the HP versions, or 82’s. I have only seen a few 82’s with a defect compared to numerous uv5R’s with some defect.

If you have to buy a uv5R look for the versions that are Baofeng/Pofung which means it is the export version which is supposed to have QA checks per ISO9001 certification.

49350. Radio constant transmit when USB programming cable connected

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-22 19:38:00 UTC
From: abreuma677@...
Topic: 49350 Message: 49350

From day 1 my radio has gone into constant transmit mode when the USB programming cable was attached. CHIRP would still program the radio but I had to be quick or the radio got warm near the antenna connection.

Recently attended a local "ask the Elmer" session and someone was programming these radios for new HAMs and I noticed the Elmer doing this didn't have the transmit problem. When I mentioned my issue to the Elmer he scratched his head a little as he had never seen this.

When I got home I got my laptop, radio, cable, external speaker mic and meter out to check my setup out. I discovered that when the USB cable was connected to my Windows 7 laptop it would engage the transmit. Poked around in Windows Device Manager for COM4 and under the "Power Management" tab there's a check box "Allow the computer to turn off this device to save power" which when checked causes this radio transmit problem. Unchecking this option solved the problem - for me.

Just passing this along.

i got the UV-5R 12 days ago.
I jus realize that VHF side of the radio it's not making in to the repeater... I guess it's low in output. (The UHF are just doing fine)
I did not realized in the beginning, being a new ham I was monitoring mostly.

I have a 2 meter radio it's receiving just fine when is next in to the same room.
I tried with other dual band diamond antenna model RH77CA.

So what do you thing I should do?
I tried to reset 2 times it's the same.
Any hard reset feature?
or any other suggestion?

Someone can help?
Thanks!
K

Surprisingly enough they apparently learned about cross band repeaters with only one lesson (many hams need more than one lesson).

Use a mobile, set on low power, with a fan (built-in or added on), and keep the transmissions short -- anything else will make the gods of radio angry and cause them to let the magic smoke escape from your radio.

If you want to see what Baofeng China considers to be their *standard* product line, visit their website at www.baofengradio.com (notice that it's NOT baofengtech). If the radio isn't listed there, it's a good bet that the radio is a "one off" production run for a particular dealer (like the UV-5R V3, the BF-F9V2+, the BF-F8HP, and all of the various UV-5R(x) models).

That doesn't mean that the radio doesn't "work right", it just means that Baofeng China made a radio to the spec request of a particular dealer, which could mean that radio won't be exactly the same configuration as others, and free software like Chirp may (or may not) support it before your new radio arrives.

Are you sure VHF is low? VHF and UHF don't work the same. It could just be you location and obstacles between you and the repeater. Find someone with a watt meter that can measure your VHF and UHF out put.

There is no "hard" reset. The closest thing to that is to upload a "factory" CHIRP Radio Image (*.img) file that matches your radio's firmware version to your radio. See "Recovery from Erratic Behavior" on the miklor.com website.

I have another handheld radio, a 2m/440 Yaesu that transmit and receive 8 VHF and 5 UHF repeater from my home in LA, but not with this Baofeng! this one a UV-5R only works with UHF nothing on VHF. It shows that is transmitting on VHF on the LCD screen, works in simplex with my other radio and scanner in the same room, but not with a repeater like the other radio that I have... That's why i assuming that it is law in VHF transmitting.

Any other suggestions?

Subject: Re: [baofeng_uv5r] Low on VHF

I have another handheld radio, a 2m/440 Yaesu that transmit and receive 8 VHF and 5 UHF repeater from my home in LA, but not with this Baofeng! this one a UV-5R only works with UHF nothing on VHF. It shows that is transmitting on VHF on the LCD screen, works in simplex with my other radio and scanner in the same room, but not with a repeater like the other radio that I have... That's why i assuming that it is law in VHF transmitting.

Any other suggestions?

Richard is correct. The problem that many American buyers of Chinese radio

products have is that they expect Chinese suppliers to play by the same rules as American suppliers - they don't.

It's the same Garbage In, Garbage Out (GIGO) standard that's used in the information technology field, so it doesn't matter if Amazon ships your order either, as they are still sourcing the product from a Chinese supplier and Amazon's version of quality control is to simply count the incoming boxes, verify the boxes have an acceptable Amazon bar code sticker placed on them, and put them away into inventory until your order is placed and the product is pulled for shipment. At no point do they even verify the box has the correct components (like a charger, strap, battery, etc.) and they certainly don't verify that it works to any published spec. That's simply too costly for them to do when dealing with hundreds of thousands of incoming products at their various warehouse locations around the country.

Many of the UV-5R sellers (that use Amazon's FBA service) actually end up selling the radios below normal dealer cost. Perhaps all of those tiny Chinese suppliers just source so many that they are able to get better pricing than normal dealers (but that's unlikely). I have used Amazon myself to source radios when a customer needs them in a couple of days and we can't wait for normal Chinese shipment time or costs from Baofeng, TYT, Wouxun, etc.

I can verify that we normally order several extra radios as "spares" due to the fact that we normally find about 10% of the radios purchased through Amazon to have some kind of issue (missing parts, bad displays, notes in boxes from previous buyers, etc.). Most buyers think Amazon's no questions asked return policy is great, and I guess they assume Amazon either throws away the returned products or sends them back to the Chinese suppliers - WRONG.

Odds being what they are, a normal Amazon buyer may never see a "bad" radio when only buying 1 or 2, but your odds of seeing one increase greatly when buying 25+ at a time. Now when we find an issue with one (and again we don't normally source through Amazon, but we have used them when we're low on stock and a customer places a larger order for radios that they need programmed right away) we place a small note under the charger stand informing the next customer why we returned that radio. In fairness, we didn't come up with that idea, but we found 2 of those notes in separate orders during a 2-3 week period of time, one under a Baofeng UV-5R charger and the other under a Wouxun UV-899.

Lots of writing against the UV5R HT that has been purchased in many other Countries.
I would think that Amazon would get fed up with returns and stop selling them.
My PX888K HT's work fine and I have 7 Wouxum HT's and I program them manually also.
I read that ALL UV5R HT's have the same board and they work fine in china but different FCC regs.

Most likely you have a cable that will work with driver versions above 3.2 I bet Windows updated your driver in an update. Check the driver version, if anything above 3.2 either roll it back or totally remove it and install 3.2 again.

Problem will be solved

Subject: [baofeng_uv5r] Radio constant transmit when USB programming cable connected

From day 1 my radio has gone into constant transmit mode when the USB programming cable was attached. CHIRP would still program the radio but I had to be quick or the radio got warm near the antenna connection.

Recently attended a local "ask the Elmer" session and someone was programming these radios for new HAMs and I noticed the Elmer doing this didn't have the transmit problem. When I mentioned my issue to the Elmer he scratched his head a little as he had never seen this.

When I got home I got my laptop, radio, cable, external speaker mic and meter out to check my setup out. I discovered that when the USB cable was connected to my Windows 7 laptop it would engage the transmit. Poked around in Windows Device Manager fo r COM4 and under the "Power Management" tab there's a check box "Allow the computer to turn off this device to save power" which when checked causes this radio transmit problem. Unchecking this option solved the problem - for me.

Just passing this along.

Subject: Re: [baofeng_uv5r] Cross Band Repeat with an HT

Surprisingly enough they apparently learned about cross band repeaters with only one lesson (many hams need more than one lesson).

Use a mobile, set on low power, with a fan (built-in or added on), and keep the transmissions short -- anything else will make the gods of radio angry and cause them to let the magic smoke escape from your radio.

From: mailto:baofeng_uv5r@yahoogroups.com

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Cross Band Repeat with an HT

One of the uv5R setups with two radios and a controller burned up one of the radios the LCD was burnt it got so hot. It was brought back and they asked if it could be fixed (chuckle) The uv8D got hot too but after they burned up the uv5R’s they only used short direct pointed comms. So the uv8D was operated at low duty cycles and with long periods of inactivity. –after the uv5R lesson was learned.

The Zastone mobile was used more, but was set up on low power and had a 12v computer fan rig that pulled some of the heat away. So far did not have any problems.

Biggest prob was a bored control operator sitting up on a hill for long periods of time. (I was told)

The uv5R setup lasted half a day before burning up.

I think they said they had 25 people and were using quads on trails the roving quad group was the ones using the repeater to talk back to a base area and the hill spotters.

Subject: Re: [baofeng_uv5r] Cross Band Repeat with an HT

Disregarding the political commentary and the advisability/inadvisability of the activity, I do see one technical question:

What is the life expectancy of these HTs used in cross-band repeater mode, especially at high ambient temperatures.

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Re: Just in case....

They are using this function at the border areas here. Volunteers are watching the border to see what is coming across a few at the spotter hills are putting their radios in repeater mode if the hills are blocking the simplex ranges for the roving scouting parties.

The are using Zastone MP900 versions to do this with solar hookups but also Uv8D’s have been used. I supplied a few Renogy portable panels too.

I was asked to go down and assist in setting some of this up but someone else went and did it. Too bad DHS is basically incompetent under the current regime , or ranchers and property owners would not need to be doing this.

Also check your offset, a few times I forgot to completely erase a channel I added which left an offset at 600 khz when it was supposed to be 5Mhz and did not catch it right away.

Just go to either line A or B select in menu the correct MDF A or B and select frequency – point to the repeater that doesn’t work on xmt see the offset shift to verify it is correct.

Sounds almost like the US military supply system, we would tag bad boards and reorder new ones with COG of 7G and end up getting the broken one back or one we sent in a few months before.

I once received an IPA circuit board for a Satcom system that still had my original voltage and troubleshooting markings on the board that was 1-year later after it was turned in. It sat someplace for 1-year and was reissued bad back to us.

We started marking boards with grease pens with smiley faces, if we got back anything with a smiley face on it we did not even waste our time installing it.

I still remember one command during budget cut years telling us to paint and shine bad equipment to be reissued out or marked calibrated.

I think TOA stands for Time of Arrival. This device has 2 sets of antennas. If you are not aimed at the source of the signal, there is a tone imposed over the top of the signal you are tracking. When you are aimed at the source, the tone disappears, letting you know it is either in front of you or behind you. Change your location by a couple of hundred feet and try again. The source will be in the direction both lines cross at. This kit is not terribly hard to put together. It has been a long time since I tried soldering and didn't have much trouble. It does seem to work well for an inexpensive device.
There should be lots of information if you look under "radio foxhunting", maybe at the ARRL.ORG web site. The same methods are used for tracking ELTs, EPIRBS, mountain locator units, etc.

I would think that Amazon would get fed up with returns and stop selling them.

Amazon would "if" they weren't still making money on the sales. Amazon charges the sellers a monthly fee of $39.95 to list their products (regardless of any sales made), plus they charge a commission percentage (it can vary anywhere from 6% to 20% once the sale happens

* - depending upon where the UV-5R is listed for sale (electronics, home, auto, etc.)*
Depending on how the customer asks for a return (plus how the buyer originally ordered the item) determines how much Amazon refunds to the seller, so the seller can pay $39.95 to list items that month, sell only 1 unit that month (that Amazon lists under "Home" products) and gets charged a 20% commission fee - on top of the $39.95 already charged, and not only does Amazon charge the above fees, but also can ding the seller for return shipping costs plus hold back a percentage of the original commission charged as well.

Subject: Re: [baofeng_uv5r] OT: Anyone has found any neat ready made Fox Hunting antenna kit(s)?

I think TOA stands for Time of Arrival. This device has 2 sets of antennas. If you are not aimed at the source of the signal, there is a tone imposed over the top of the signal you are tracking. When you are aimed at the source, the tone disappears, letting you know it is either in front of you or behind you. Change your location by a couple of hundred feet and try again. The source will be in the direction both lines cross at. This kit is not terribly hard to put together. It has been a long time since I tried soldering and didn't have much trouble. It does seem to work well for an inexpensive device. There should be lots of information if you look under "radio foxhunting", maybe at the ARRL.ORG web site. The same methods are used for tracking ELTs, EPIRBS, mountain locator units, etc. Jardy Dawson WA7JRD Ham Radio Sent by hurling dead pigeons over the wall by trebuche. Yes the driver information is:

Driver Provider: Prolific
Driver Date: 7/26/2012
Driver Version: 3.4.36.247
Digital Signer: Microsoft Windows Hardware Compatibility Publisher

I'm going to leave it alone since it works - now. I did download the older driver and have it stashed on this laptop in case this becomes an issue in the future. Thanks for the information!

I had this problem on and off using this driver 3.4 and that was with GI cables. Certain times it would work and other times it would lock on transmit. I just stuck with 3.2 and that works with all cables.

This problem MIGHT come back as it did for me, I was going to scope what was present on the pins to see if it was a floating noise source or voltage causing this to operate erratically. I ended up just rolling back the driver instead.

Well,
Thanks for all your responds and help!

It is set on hight output 4 watts (did not check with a meter, I don't have one)
And yes, it is set on 000.600 offset and I tried with 6 other 2 meter repeater all of them are not responding. I tried with a Kenwood 2 meter handheld radio works with all the repeates.

It's fully charges batteries and a dual band Diamond RH77CA antenna on the Baofeng UV-5R. For the info, works just fine with UHF, I get a respond from repeates. Also on VHF works fine in the same room on simplex frequency maybe it is transmitting on a very low power some tiny milliwatt?

I don't know what to do next... :(

Thanks again,
KK6SEI

Again, Linux just worked.

Whatever you have, if it works don't fix it!

Never had any issues with this cable on Linux.

But thanks for that workaround for Windoze. I still have one machine here running it and it happens to be in the warmest room in the house. Still freezing here in Mass.

Do you have the 600KHz offset direction correctly set? I imagine that
you need -600KHz

Have you tried simplex transmission to one of your other radios?

If you have someone who can help you with a simplex test, have one radio go for a drive. You should get at least a couple miles apart and still talk which means power is good and programming would likely be the issue.

A workaround for the stuck on TX problem with fake cables: Before connecting set the freq to something harmless, then set the TOT (Transmit timeout timer) to the minimum (30 sec) and set the power to low. Then when you connect it goes into TX on a harmless freq and stops after 30 sec. Then you do your upload/download when the TX light goes out.

This doesn't eliminate problems but it minimizes them and prevents overheat if TOT is set high, like 90 sec. The stock antenna will get very hot on UHF in 90 sec.

49387. Nagoya NA773 vs NA771R

Yahoo group: baofeng_uv5r (2015)
Date: 2015-03-24 14:06:35 UTC
From: cprendon@...
Topic: 49387 Message: 49387

Recently Baofeng Tech introduced the Nagoya NA771R a retractable version of the NA771. It is not listed on Nagoya's Reuex web site.(nagoya.com.tw). However Nagoya has had the NA773 for some time which is identical in specs and appearance.

Anyone aware if this NA771R is just a Baofeng Tech rebranded NA773?

49388. Re: Nagoya NA773 vs NA771R

My 771R is longer than the 773 by a half inch

Also they have different bases (but I got them 1 year apart)

Maybe that is the difference?

It is set on hight output 4 watts (did not check with a meter, I don't have one)
And yes, it is set on 000.600 offset and I tried with 6 other 2 meter repeater all of them are not responding. I tried with a Kenwood 2 meter handheld radio works with all the repeates.

It's fully charges batteries and a dual band Diamond RH77CA antenna on the Baofeng UV-5R. For the info, works just fine with UHF, I get a respond from repeates. Also on VHF works fine in the same room on simplex frequency maybe it is transmitting on a very low power some tiny milliwatt?

I don't know what to do next... :(

Thanks again,
KK6SEI

Hi, my name is James and I'm a Radio-Aholic.

Yes, I think I need to join one of those addiction groups. Because I just bought ANOTHER Baofeng varient the UV-5X... Why? Because I could.

So anyway, I gotta say I really like this little radio. It "feels" lighter than the 5R and is definitely lighter than the F8HP. I really don't know or think that this radio is truly water resistant, but at less than $40.00 it's not that important.

The microphone seems to be a little more sensitive, but that bloody crappy stock short duck antenna comes with it. Pooh... ANYWAY I've tried this thing with the A-V85 antenna from my F8HP, and WOW what a difference. The GT-3 which has the same "guts" as this little gem comes from Radioddity with a nice light skinny 23cm antenna (made by SainSonic). So I just happened to have one of those SainSonic antennas lying around, and the radio seems to work really well with that antenna. I also have the 36cm version which works even better. Basically it shaves weight off the radio and you still get some OK gain. Kinda nice.

Scanning is respectable and I do like that the flashlight is "recessed" so you don't have a lot of side glare, but there are a couple of design flaws which kinda irk me.

Beltclip...

The beltclip which comes with this radio is really not very good. All the other radios I have, the beltclip at the bottom where it fits over your belt, is a "U" shape. So if the radio slides up on your belt, the "U" catches it. The 5X belt clip is a little smaller than the standard 5R, and it "L" shaped. So basically there is nothing to catch the radio if it starts to slide out of your belt. But I did have a replacement Baofeng belt clip on hand, it fits, and problem solved.

Speaker-Mic port...

I use a Speaker Mic ALL the time. This radio has the same setup as the Wouxun KG-UV8D where the cover folds "down" from the port. After you plug in the speaker-mic, there's that "flap" of cover sticking out there, and it does nothing but get in the way. There is a screw at the bottom to remove the flap, but I have to say the UV-5R cover and the new AnyTone TERMN-8R covers by folding "back" make a cleaner access.

Other than those two little issues, this little radio is starting to grow on me big time. Too bad it doesn't have the accessories or extended battery that the 5R has.

As my addiction grows, and I get more CCJ Radios around here, I'll probably start selling some of them off.

Have you done any performance comparison between the two? I am not impressed with my 773. Not much better than the A-V85 or NA701 really, fully extended of course. I wouldn't want to spend almost $20 for another neutral antenna.

---In baofeng_uv5r@yahoogroups.com, <billyoder529@...> wrote :

My 771R is longer than the 773 by a half inch

Also they have different bases (but I got them 1 year apart)

Maybe that is the difference?

Yea. That's what we need is a bunch of guys sitting around a circle talking about bad experiences when using too many HT's. Relationships destroyed, lost jobs, looking for new HT fixes online late at night. What we really need is a drug to inhibit the cravings. Something like Icomisal or Yaesuerix. Maybe Baofix.

I keep seeing the timeout timer being touted as a workaround for the radio transmitting while the programming cable is plugged in and I don't get it. It doesn't make sense to lower the TOT value for programming and then raise the TOT value back up for using the radio. You should never want your radio to go into transmit when you are programming, not even for a short while.

The goal should be to fix the problem so the radio won't transmit period. If you can't resolve the problem by installing a device compatible driver or getting a programming cable with something other than a Prolific USB-to-TTL type chip in it, then I would suggest programming a TX inhibited channel and "tune" to it when you are programming.

"The goal should be to fix the problem so the radio won't transmit period."

Jim,

I think Richard would agree with you, however, there are folks using these radios that just don't seem capable of being able to correctly troubleshoot what's really going on. Sometimes a "workaround" like this is just a better use of your time vs. spending an hour helping another clueless individual (standing in front of you at a booth) harping on again and again how his (or her) illegally made Prolific clone cable (neither the radio or the cable purchased for you in the first place) simply "can't be a problem"

because it has the word Baofeng on it.

Not picking on all Baofeng users, BTW, as I've also had similar conversations with TYT and Wouxun users at various shows.

That is why it is called a workaround. Your suggestion about a TX inhibited channel is even better. Both are a hassles created by all these cheap counterfeit cables and people often not being familiar with this issue until they have purchased one. You are right, a proper cable and drivers should be the end goal.

Unfortunately many of us didn't discover miklor or this group until AFTER we purchased our first radio and cable. In my case the seller of the radio RECOMMENDED I buy a counterfeit cable they sell with the radio. Caveat emptor...

Does the repeater you want to connect to require a PL tone?? Also, do you want a + or - offset for that repeater?

If you are tuned to the repeater, you should be able to hear it, if nothing else.

Actually, if you program many of them Yes indeed need to fix it. However, many do a one time program on 1 radio and never change the settings again/ if they do they just use the manual menu changes.

Best bet is just to use driver 3.2 which does not do any of this and keep it from updating the driver. To do this be sure to run Windows update and look for the prolific update to show up then hide it so it is not accidently installed in a group update selection (which happened to me on one computer) also buy a decent GI cable too.

As Craig says explaining USB drivers and issues and steps to take, I see eye glaze over for the majority wanting to buy these radios. These radio are mostly sold to the beginner Hams and soon to be licensed or experienced Hams on a budget. A small percentage are buying with no intention to get licensed and get them for just simplex use or replacement for a 1W bubblepack GMRS radio.

Once setup for these channels they never touch the programming again.

To tell you the truth, I am not a big fan of 8.1. I just purchased two new PC’s. a laptop and desktop. I loaded all the available updates. Even turning on the computer, the first screen I get is something went wrong and it needs to reboot. That is happening too often, maybe 20 % of the time. I have a laptop that is running 8.0 that is asking me to update to 8.1. I never will.

Oh no I'm in North Hollywood.
Thank you so much!
I really appreciate your help!

I hope they will send another unit.
I send them a video explaining about the problem, let's see what happens...

Regards
K

Subject: RE: [baofeng_uv5r] Low on VHF

Well,
Thanks for all your responds and help!

It is set on hight output 4 watts (did not check with a meter, I don't have one)

And yes, it is set on 000.600 offset and I tried with 6 other 2 meter repeater all of them are not responding. I tried with a Kenwood 2 meter handheld radio works with all the repeates.

It's fully charges batteries and a dual band Diamond RH77CA antenna on the Baofeng UV-5R.

For the info, works just fine with UHF, I get a respond from repeates. Also on VHF works fine in the same room on simplex frequency maybe it is transmitting on a very low power some tiny milliwatt?

I don't know what to do next... :(

Thanks again,

KK6SEI

I did programmed it the right way...
I have another 2 meter radio a kenwood I can hit 7 repeaters from my location and get a full signal. Unfortunately not with the Baofeng.

And in simplex, the other radio receives only if it's only to close.

Thanks

Althouh you may think you programmed it correctly, I think most (all?) of us have a little trouble programming the Bofeng's from the keypad the first time or two, a Baofeng is as user friendly not a Kenwood or Yeasu or Icom. Did you program it usig the factory software, CHIRP, or the procedure on Miklor.com, or did you use the "manual" that came with the radio.

You've mentioned the offset, but how about the PL tone? Can you hear the repeater when someone else is using it? Try reverising the setting (*) from the keypad to see if you can hear the Baofeng on the kenwood.

OR....

You may indeed have a bad unit,

That my friend is darn near a loaded question. What works for one person, may not work for another. There's all kinds of data out there about how solid a radio is or how much power etc etc etc... But what it really comes down to is did you feel like you got a good radio for the price and does it "fit your hand".

Many people will sing the praises of the "big three" (Kenwood, Yaesu, and Icom) and how their radio is far better than your radio because they spent 2-4 times as much to talk analog on a repeater. But I just smile, and use my CCJ's and nobody really knows the difference in the quality of my radio when I'm talking on a net or just rag chewing. So don't let a "name" dictate your choice..

All that being said, I actually use different radios in different situations. I even have a couple of the older model UV-5R's that I experiment with. But right now there's one radio that I could use for all situations. That's the Baofeng BF-F8HP with the 3800 mAh extended battery. I can do a lot of stuff with the BF-F8+, but I like the little heavier radio.

For an "all around" radio, for me it takes the cake. Plenty of power when I need it, Not really "buggy" (I don't like it that the new chipsets and firmware won't let you clone a radio), and pretty darn durable. If I need that little extra kick, I can just hit a button, and bump the power up to the 8 watts, or tone it down to 1. I normally run everything at 5 watts on the radio. This is also my main "rag chew" radio simply because it does have the larger heat sinks in it, and on 5 watts will not heat up when I'm going on and on and on and on and on.....

My second choice for "all around" radio is the Wouxun KG-UV8D. What a NICE display and LOADED with features. BUT it tends to be a "battery hog" when compared with the 5R variants.

Right now though, I'm playing around with the Baofeng UV-5X and the AnyTone TERMN-8R. But I don't think that either one of those will be my main "rag chew" radio, but the UV-5X shows a LOT of potential for back woods outings and the TERMN-8R has so many features, and will most likely work well if I find myself in a "mixed mode" environment.

So if your question is "What radio do I get for all around use? Something I can toss in and out of the vehicle or slip in the bag." I'd go with the BF-F8HP, Extended battery 3800 mAh, the stock antenna that comes from BaoFeng Tech, the faux leather case, and start jabber jawing. OH... and the nice thing about that extended leather case is that all you have to do is open up the bottom flap and then drop the radio in the charger. No need to take the radio out of the case.

Same conclusion you have is also mine. However, add the Baofeng A58 (nice and heavy like a Yeasu or ICOM water-proof version in an uv82 feel package. Also look at the TYT F9D Tri-banders, a GT3 feel but with a scrambler function and voice companding- loud as heck too – good 7W output.

I agree with the uv8D I run the bigger hi-cap batteries now in mine.

All in all- HT’s and radios are like firearms. You end up with a large amount of them, not just one , and each has a special look or capability the others do not have. So you end up rotating through your favorite radios. That is what I do depending on what I am doing.

Hopefully you understand that the Baofeng radios totally IGNORE any offset settings (+,-, or offset settings) you have programmed in Channel (memory) mode - offset settings only work in Frequency (VFO) mode.

You also can't modify an existing Channel memory with changes to offset info, pl tones, etc. - you need to completely delete that Channel (memory) and re-enter it. So if you are trying to enter 146.940 (with a .600 offset) in a memory, you need to enter BOTH the full transmit (146.340) and full receive frequency (146.940) into your memory (Channel mode IGNORES any +,-, or .600 offset info you entered into Frequency (VFO) mode.

However, on a UV-5R, you can program a channel into memory,by saving it twice. first as normal, then as reverse intothe same memory. Get everything working as it should, thenclear a memory, and program twice, like you have to. The
first time you get the receive/simplex memory and the secondtime, in reverse, you program the transmit/offset memory.
BTW, I found out you can program the transmit part of thememory as many times as you want but the receive part onceper memory clearing.
I still prefer CHIRP programming.

HTH

> per memory clearing.

This is correct. The first write to an empty memory creates a simplex channel in the target memory (TX = RX). If you are programming a simplex channel, then only one write is necessary.

Then the second (and subsequent) writes will update the TX frequency of the target memory with the frequency displayed in the VFO. That is how repeater, odd-split and cross-band channels are created. You could also key in the RX frequency change the memory back to a simplex channel if you wanted to.

You can also update the T-CTCS tone or T-DCS code as many times as you want (to add a tone/code, change the T-CTCS tone/T-DCS code or even remove the tone/code. You must be sure to also key the current TX frequency into the VFO before doing this or you will unknowingly change the TX frequency.

So for most users wanting to program their radio manually, it is probably better to tell them to erase the memory and start over from scratch.

Agree with what Jardy and Richard have stated. I also like the ability to turn off one band on the display with various TYT and Wouxun model radios, especially when you are giving one to someone that barely understands how to key it up.

> per memory clearing.

This is correct. The first write to an empty memory creates a simplex channel in the target memory (TX = RX). If you are programming a simplex channel, then only one write is necessary.

Then the second (and subsequent) writes will update the TX frequency of the target memory with the frequency displayed in the VFO. That is how repeater, odd-split and cross-band channels are created. You could also key in the RX frequency change the memory back to a simplex channel if you wanted to.

You can also update the T-CTCS tone or T-DCS code as many times as you want (to add a tone/code, change the T-CTCS tone/T-DCS code or even remove the tone/code. You must be sure to also key the current TX frequency into the VFO before doing this or you will unknowingly change the TX frequency.

So for most users wanting to program their radio manually, it is probably better to tell them to erase the memory and start over from scratch.

Subject: [baofeng_uv5r] Re: Need to start new group...

That my friend is darn near a loaded question. What works for one person, may not work for another. There's all kinds of data out there about how solid a radio is or how much power etc etc etc... But what it really comes down to is did you feel like you got a good radio for the price and does it "fit your hand".

Many people will sing the praises of the "big three" (Kenwood, Yaesu, and Icom) and how their radio is far better than your radio because they spent 2-4 times as much to talk analog on a repeater. But I just smile, and use my CCJ's and nobody really knows the difference in the quality of my radio when I'm talking on a net or just rag chewing. So don't let a "name" dictate your choice..

All that being said, I actually use different radios in different situations. I even have a couple of the older model UV-5R's that I experiment with . But right now there's one radio that I could use for all situations. That's the Baofeng BF-F8HP with the 3800 mAh extended battery. I can do a lot of stuff with the BF-F8+, but I like the little heavier radio.

For an "all around" radio, for me it takes the cake. Plenty of power when I need it, Not really "buggy" (I don't like it that the new chipsets and firmware won't let you clone a radio), and pretty darn durable. If I need that little extra kick, I can just hit a button, and bump the power up to the 8 watts, or tone it down to 1. I normally run everything at 5 watts on the radio. This is also my main "rag chew" radio simply because it does have the larger heat sinks in it, and on 5 watts will not heat up when I'm going on and on and on and on and on.....

My second choice for "all around" radio is the Wouxun KG-UV8D. What a NICE display and LOADED with features. BUT it tends to be a "battery hog" when compared with the 5R variants.

Right now though, I'm playing around with the Baofeng UV-5X and the AnyTone TERMN-8R. But I don't think that either one of those will be my main "rag chew" radio, but the UV-5X shows a LOT of potential for back woods outings and the TERMN-8R has so many features, and will most likely work well if I find myself in a "mixed mode" environment.

So if your question is "What radio do I get for all around use? Something I can toss in and out of the vehicle or slip in the bag." I'd go with the BF-F8HP, Extended battery 3800 mAh, the stock antenna that comes from BaoFeng Tech, the faux leather case, and start jabber jawing. OH... and the nice thing about that extended leather case is that all you have to do is open up the bottom flap and then drop the radio in the charger. No need to take the radio out of the case.

I read the manual then watched a 2 part U tube on programing this little beast manually.
I go 2 repeaters in and now doing it on my own.
When I go out of the area I can punch in repeaters I want.
For mobile use i'm using the MFJ dual band 6 and 2 meter antenna.
My collinear antenna had so much rust and rotted insulated space washers so I took that off and sanding down that giant magnet.
Going to drill a larger hole for better coax then put it back.
I have to dig out my old Radio Shack 25 watt AMP.
Now all I have to do is get the FT 8GR working like it should.

Hopefully Richard they run their Crossroads shows in CA far better than they do here in AZ. It's not uncommon for them (here) to forget about things like internet or cellular access, so you end up using the old-fashioned credit slips and hoping they'll clear after the fact. Good luck at the show, we're doing one as well this weekend.

Sounds like you nailed it. If in simplex the receiving radio has to be very close to receive then indeed your TX power is most likely low.

---In baofeng_uv5r@yahoogroups.com, <kk6sei@...> wrote :

I did programmed it the right way... I have another 2 meter radio a kenwood I can hit 7 repeaters from my location and get a full signal. Unfortunately not with the Baofeng.

And in simplex, the other radio receives only if it's only to close.

Thanks

Good! I have set down local repeater information in "spreadsheet" format for convenience:

RX frequency
Offset or TX frequency
Shift
Pl tone
Name

Then, you can systematically program by hand, if you wish.

Chirp, or factory software, of course, makes it easier. We travel a lot, so I have files made up of the places I regularly visit, such as where our children live, etc. Just swap in the right file, and off we go.

Don't forget the national simplex calling frequencies for 2 meters and 70 cm. We live in a tourist area on the Delaware coast (Fenwick Island). It is quite interesting how many people traveling through will key up on the calling frequencies when in town. We then direct them to the nearest local repeater.

Also very useful to program in weather, Fire/Police, Coast Guard channels (no xmit, of course).

Craig,

I found out sometimes “someone”" unknown” is running some type of jamming device to knock off the internet and cell phones. Reports from long time vendors state this is done to get everyone to pay the fee to use the area hotspot.

Not sure what is true or not and it might be just too much RF inside the metal halls or shielding causing the drop outs and interference..

Or a combo of all three

Or maybe someone unknown jams it all, and scams the traders when they only have paper credit card facilities available to them? :-(

Well, we fixed the problem by taking one of our zBoost cellular repeater units with us to various trade shows. Now when we find out the location isn't really "in-town" but rather 20-30 miles outside of town (with spotty cell coverage outside the building and zero inside the building) we still have a local hot-spot which now allows us to run the credit cards via iPhone or iPads at the booth.

Not having been to this weekend's show location before, I'm packing it into the vehicle tonight (just in case).

I think I got mine for 14.00. It is not too user friendly when the extended leather case is on, but it does work nice as an extra option for charging.

I actually have a radio on this charger clipped next to my chair with a speaker mike that I can rag chew (yeah LOTS of tag chewing in Hawaii) while kicked back in my chair.

It's what us retired guys do.

I have no clue if this has been asked before or not so if it has please excuse me. One of the guys in my club programmed my radio with several of the repeater frequencies here in Montana. On the local repeater it works great. I have even added a magnet mount antenna to my car for longer range and have also gotten the car charging system for it.
The problem I have is that when I get to an area covered by another repeater my friends there can hear me just fine but I am unable to hear them however I do know they are transmitting because my green "receive" light is on and goes off when they stop transmitting. The guy who programmed my radio claims that my receiver is out. If that were so then why am I able to chat locally? I have a tendency to think it is a programming problem and that particular frequency needs to be re-programmed as does a friend of mine. Does anyone have a suggestion?

Try re-programming it. Pay especial attention to PL tone (if needed), offset and shift values. Look them on on any of the on-line databases or in the ARRL repeater handbook.

There are detailed directions on this group, or in the instructions for hand programming.

When I got my first Chinese HT (a Wouxun), I hand programmed about 9 local repeaters into it in well less than 20 minutes.

Goes MUCH easier if you write down the parameters needed, then program them in one at a time.

I find it most useful, if possible, to test the settings before writing them to memory.

It sounds like the radio may have been programmed with a receive tone and
the repeater doesn't transmit one.

Paul is correct, your friend probably had PL tone set for receive (and not just transmit), which is why you can't hear that repeater's audio.

We have problems down here in "slower lower" Delaware with leakage from cable TV on the same frequency as one of our local repeaters. To get around that, we have the repeater transmit the PL tone as well as key up with it. Pretty nicely solves the problem. Obviously, if you don't have the PL tones set correctly, you can likely neither transmit or receive, or some horrible combination of both.

Googling how repeaters work is insightful to the new ham, or some of us that have been on HF most of our lives.....

The firmware is not upgradable.

Find the "real" firmware version, download the matching CHIRP image to your computer, then upload it to your radio.

If that fixes it, transfer your channels to that image using copy-and-paste. Don't upload your original image or you will change your radio back to the way it was.

Unless you have a 2 year old radio, it is a safe bet that you do not
have BFB297 firmware. All UV-5R radios (and variants) with firmware
versions after BFB297 display BFB297 in the [3] key + Power-on message
(the exception is a radio with BFS313 firmware reports BFS297).
Because of this, the [3] key + Power-on message can no longer be used
to determine a radio's firmware version.

The only way to determine the "real" firmware version the UV-5R, UV-82
and BF-F8HP radios (and their variants) is to download the memory
image into CHIRP and look at the Settings -> Other Settings menu
panel. It is shown in Firmware Message 1 unless Firmware Message one
is " VER ". In that case the firmware version is shown in Firmware
Message 2.

A link to a collection of CHIRP "reset" and "factory" images can be
found on the Miklor.com "Recover from Erratic Behavior" page.

Hey Guys,
I'm no brainer with all this PL and Chirps,etc.,But I just put in both the RX and TX tone frequency and I keyed up the repeater but the tone for receiving has to transmit the tone I had aand I saw the light go on but heard nothing.
I set the tone back to TX only and I was able to hear the repeater.
Some repeaters are set up for tone Squelch.
It could also be they changed the TX pl tone on the repeater.
Is there another repeater you can try>??

Bob,

Apparently you didn't read my post either. Radios with BFB297 firmware haven't shipped for 2 years. Unless your radio is 2 years old, it cannot have BFB297 firmware. Powering on your radio with the 3 key pressed does not tell you the "real" firmware version any more.

From: buzzygirl@...
Topic: 49464 Message: 49464

Hi group, I bought a new UV-5R and have been manually programming local repeaters into it while I wait for my FTDI cable to come from Amazon. Not too hard to program manually, just tedious.

However, I cannot seem to scan my memory channels. I checked the users guides on Miklor and press the "scan" button for several seconds, but it does nothing. It scans fine in frequency mode. I'm not sure if there is something else I need to be doing to scan my memory channels?

Thanks!

Bob,

Apparently you didn't read my post either. Radios with BFB297 firmware
haven't shipped for 2 years. Unless your radio is 2 years old, it
cannot have BFB297 firmware. Powering on your radio with the 3 key
pressed does not tell you the "real" firmware version any more.

Have you powered off your radio and powered it back up again?

The radio only scans channels that are in the "scan list". The "scan list" is built from channels that have the "scan_add" bit set. Manually programmed channels automatically have the "scan_add" bit set but the "scan list" is only updated when the radio is powered up or rebooted. So until you power cycle your radio, the newly added channels won't be scanned.

Dear beargyrils,
If it's ok with you and if don't mind,
Can you email me your backup copy of you chirp saved file since we both have the same version and yours working fine, I would like to try it on my radio hopefully your file works with my radio.

Your help is greatly appreciated

My email is: contact@...

Regards,
Kero

Actually you can send to me too. I have that same firmware and can at least try the repeaters which would be near me too.

This way the repeaters should respond for a quick check

I've had the radio only since yesterday and have powered it off and on again a number of times, that is, simply turned it on and off. I programmed nine local repeaters into it but pressing the "scan" button does nothing in channel mode. When you say rebooting, do you mean I need to do something other than just turning it off and back on again?

Thanks for your help!

Paul,
If there is a cable ‘leak’ in your area, you should be able to get that resolved. We had the same situation here with one of our local repeaters.
You should be able to drive the area with a radio on simplex and narrow down which pole amplifier is causing the issue.
Report the issue to someone in the Upper Level of the cable company. If there’s no response within 7 days, report the issue to the Commission.
Our issue was resolved within 7 days.

Just a thought.
John

Subject: [baofeng_uv5r] Re: Not receiving

We have problems down here in "slower lower" Delaware with leakage from cable TV on the same frequency as one of our local repeaters. To get around that, we have the repeater transmit the PL tone as well as key up with it. Pretty nicely solves the problem. Obviously, if you don't have the PL tones set correctly, you can likely neither transmit or receive, or some horrible combination of both.

Googling how repeaters work is insightful to the new ham, or some of us that have been on HF most of our lives.....

Yes. You missed something very important.

I said "The only way to determine the "real" firmware version the UV-5R, UV-82 and BF-F8HP radios (and their variants) is to download the memory image into CHIRP and look at the Settings -> Other Settings menu panel. It is shown in Firmware Message 1 unless Firmware Message one is " VER " ..."

> Firmware message 1: N5R2401 <-- no "VER" here so THIS IS YOUR FIRMWARE VERSION
> Firmware message 2: BFB297
> 6+Power-On Message 1: 141006N

You apparently did not do this "step" because you continue to insist that you have a radio with BFB297 firmware.

I said "Find the "real" firmware version, download the matching CHIRP image to your computer, then upload it to your radio." You didn't do this "step" either because your radio has N5R2401 firmware and you download the image for a radio with BFB297 firmware.

You must never directly upload an image saved from a radio with BFB firmware (what you downloaded) into a radio with N5R firmware (what you have). You must never directly upload an image saved from a radio with N5R radio into a radio with BFB firmware. The memory layout of a radio with BFB firmware is different from the memory layout of a radio with N5R firmware. This difference makes them incompatible. Loading one into the other will cause the radio to not receive unless the [MONI] button is pressed.

CHIRP daily build versions from September 2014 on detect when the user is making the mistake of trying to upload and incompatible image into the radio and aborts the upload. The CHIRP version that you had installed was protecting you from making this mistake. "Image not supported by radio" means what it says, the image that you are trying to upload is not supported by your radio.

CHIRP versions prior to this (including the nearly year old v0.4.x stable version) do not have this protection. If you use one of these older versions, you will not be protected from trying to upload an incompatible image file.

You were trying to upload the BFB297 image into your radio with N5R2401 firmware. CHIRP was correctly telling you "Image not supported by radio". Unfortunately you installed an older version of CHIRP which circumvented the incompatible image protection and and allowed you to upload the BFB297 image into your radio anyway.

Turning the radio off and turning it back on should be sufficient.

The radio "reboots" after you download from it, after you upload to it, when you perform a "reset" and after you delete the last remaining channel using menu 28.

Unless Baofeng has changed the behavior of how channels are programmed, then these channels should scan. You might do a reset and then see if the 2 channels that are created will scan. If they do, then add another, power cycle, then see if it will scan with the others. If that works, then add a few more.

Kero,

Bob does not have BFB297 firmware. You do not have BFB297 firmware.
You have N5R2401 firmware. You need to download a N5F2401 image for
your radio.

Two quick steps to check the most probable cause of the problem.

1. (For this step you do not need to be in the area of the "other" repeater) With the radio tuned to the channel for the "other" repeater, look at the display to see if the letter(s) at the left side of the display are CT or just T -- if the letters are CT, then the person who programmed your radio made the mistake of programming a receive CTCSS Tone. The only purpose of having a Receive Tone is to prevent you from hearing activity on the channel unless that signal happens to have the matching tone. Most repeaters require that you Transmit the proper tone to access the repeater but NO repeater ever requires that you have a Receive Tone active. Many repeaters do not transmit any Tone on the repeater output signal -- some do unintentionally allow the tone from the repeater input to pass through to the output, but the strength of such a tone will be low and will not work consistently. Receive Tone can be useful in certain unusual situations, but it is NEVER necessary and generally causes far more problems than any other single setting. Never use a Receive Tone unless you understand exactly how CTCSS works and what the settings do, and are certain that the repeater transmits the proper tone on its output. You can either learn how to program your radio or have your friend (or someone else) reprogram it without a Receive Tone.

2. (For this step you must be in the area covered by the other repeater). While your radio is receiving a signal from the other repeater (green light is on), press and hold the MON button on the side of the radio. If you hear the repeater while pressing the MON button and don't hear the repeater when you release the MON button, this confirms that the problem is that your channel has a Receive Tone set and the repeater is not transmitting the tone on its output.

Subject: Re: [baofeng_uv5r] Not receiving

It sounds like the radio may have been programmed with a receive tone and the repeater doesn't transmit one.

On Mar 27, 2015 2:06 PM, "danceswithwolves49@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

I have no clue if this has been asked before or not so if it has please excuse me. One of the guys in my club programmed my radio with several of the repeater frequencies here in Montana. On the local repeater it works great. I have even added a magnet mount antenna to my car for longer range and have also gotten the car charging system for it.

The problem I have is that when I get to an area covered by another repeater my friends there can hear me just fine but I am unable to hear them however I do know they are transmitting because my green "receive" light is on and goes off when they stop transmitting. The guy who programmed my radio claims that my receiver is out. If that were so then why am I able to chat locally? I have a tendency to think it is a programming

problem and that particular frequency needs to be re-programmed as does a friend of mine. Does anyone have a suggestion?

Jim
Do you still need a programing cable for this model?
It is not a uv5R or a Uv82 clone, (tried both with errors) if you need that programming cable to fool with this for Chirp support I have an extra one here to send.
The model is very close to the uv82 but under the hood the programming is different.

A better long term solution to your problem would be to first report the leakage problem to the cable provider (who will probably ignore the report), then report the problem to the FCC. If you provide proper information on the location and frequency of the leakage, the FCC will take action -- and very few cable providers like paying $10,000 per day for this particular rule violation.

Subject: [baofeng_uv5r] Re: Not receiving

We have problems down here in "slower lower" Delaware with leakage from cable TV on the same frequency as one of our local repeaters. To get around that, we have the repeater transmit the PL tone as well as key up with it. Pretty nicely solves the problem. Obviously, if you don't have the PL tones set correctly, you can likely neither transmit or receive, or some horrible combination of both.

Googling how repeaters work is insightful to the new ham, or some of us that have been on HF most of our lives.....

I'm not a moderator here,however a few of them are co-modsin other groups I'm in. Whathappens is that this group isunmoderated, So when one of theusers posts one or two, they arebanned. The message is probablydeleted from the message archive.The message still gets out thethe user base and also in thedigests. If you see them, ignorethem. The mods are on it.
These things happen. I just press delete.I'm on individual emails so I don't haveto wait for a digest dump and then haveto edit out the message I wanted to replyto late, because I wouldn't want to repostan entire digest of messages everybody hasalready read, and post a one line genericreply to a message somewhere in the digest.

Hi John and All

My take on this is that each of us should simply take responsibility to keep the others protected. If each of us think of the other and take responsibility to protect the we ALL are protected.

Steps one can take to make this happen:
1) Keep your software updates. Just like you maintain your car by changing oil, rotating tires and things like that, so is your computer.

2) Always err on the side of caution. If you are not expecting a spreadsheet from me don't accept a spreadsheet from anyone.

Do your own email security research. It's simple Google something like email security or phishing or computer virus and I'm sure you get a lot of great resources.

And this is something I do and I know it takes a lot of work, but every 3 months I whip my hard drive clean and reinstall each and every software package from scratch. It just does wonders to the system.

If you are infected that is not the time to act. It is the prevention that counts.

My 2 cents

It happens occasionally in any Yahoo Group that allows open membership and doesn't use any moderation. There are several commercial spamming operations (mostly in Asia) that specialize in spamming Yahoo and Google Groups.

The simple answer is that this group is NOT moderated, and that such occasional abuse WILL continue.

You have three simple choices:
1. You can ignore the spam
or
2. You can choose to stop receiving email from the group
or
3. You can continue to make the situation even worse by adding your off-topic, whining to the trash posted by the spammers.

The group is definitely moderated, unfortunately, you don't know what to filter or ban until it occurs.
At that point, the moderators can take action. These guys have their hands full.
All in all, this group is a lot better than some out there.

I can that that usually the user (spambot) goes on moderation almost immediately after the 1st spam post is made. I rarely see any additional posts from the same account in this group but will see several repeats in other groups that I belong to that are visited by the same spambot.

It is usually the other group members that feel a need to reply to these spam posts that cause them to live for days (or even weeks). If everyone would just ignore it, it will go away much quicker.

Jardy

<<< Just hit the delete key.>>>

Sometimes it's not that simple. With the active reading pane all it takes is to display the email and it's markup language rendered and your toast.

Prevention, and the active version of it, is the best policy. As John stated it will happen because the moderators can't screen each and every message, it's just simply impractical and will slow things down. The Bots can filter known stuff but it takes a lot of complicated heuristics to truly reduce the attempts.

Each and everyone of us should know enough to keep all of us safe. Imagine a new driver on the road?!

Thanks for indulging me, I just wanted to make a point that spam is ALL OF US kinda problem.

Or 4. You can reply to the spam which keeps it active each time a reply is sent.

Facebook support groups have been getting hammered too with Spam, the worst ones direct you to a link so your browser (if unpatched) is analyzed to see if some exploit is avail. Then a payload is sent or worse your computer starts generating the spam replies to all group and address book contacts.

Hey James
If the UV-5R has you hot and bothered, well steer away from the TERMIN-8R. That will steel your soul ☐ and break your heart☐
It's a truly slick radio ☐

LOL....

No... Actually I have a Termn-8r. And I agree it is a slick radio, but it's just not quite up there for what I like. It needs some small changes to the firmware, and THEN it will be a soul stealer.

Again... My all round general purpose go too radio is still the BF-F8HP, but why I don't know, the UV-5X is really growing on me.

I think I need to make myself carry round the TERMN-8R for a couple days and then see how I feell!

SPAM has been and still is a problem for those who wish not to see or read it. Those who send it are sometimes un-willing participants who had their email accounts or facebook account 'hacked'. Then these 'SPAM ads' are posted where ever they, the 'hacked' email owners are active.
People who set up these attacks and 'hacks' are in it for the money as they are paid depending how many 'hits' they can muster.... hence the SPAM attachments.
Phishing or digging out ways of revealing pass words and including WEB history are one of the ways 'hackers' highjack accounts. Yahoo is not doing very well with this 'problem' and may even be part of the creation of this, a matter of generating income.... One has to be careful as the internet 'neighborhoods' are populated by more than just friends and fellow HAMs.... there are predators!
One of the latest offenders are these sites like odometer.com and the cheatsheet.com. They have interesting stories to read about autos and gossip of a general nature but are at the same time filled with ads and phishing 'traps'. Every tiome one clicks on the next part of the story, the page re-loads and more lmoney making 'hits' are generated.... more money for the site and more 'traps' for the un-aware!
Much of this can be stopped or prevented simply by ajusting your mail and browser settings, also by being careful on what is clicked on.... even by accident! I have turned off my Adobe Flash player to limit ads and set my browser to a high degree os filtering and "fire walls'. All this is easy to do and if your not famillar then simply do a resource search on the WEB.
I am a moderator of several groups and owner of three, believe me this can be busy work. I have to advise all members to be aware of the problems and how to avoid email take overs. SPAM will always be there as long as the NET is alive as there is always a way to make money. I know just scratch on the surface of this problem!

From: rock.unroe@...
Topic: 49512 Message: 49514

I've had a few individuals tell me that even though they have programmed 7 character channel names into their radio using CHIRP, the radio only displays 6.

If you have a radio with N5R-219 or N5R2401 (or newer) firmware, I would like you to program a channel with 7 characters and report back how many characters are displayed.

Please report:
1. the real firmware version (in other words don't say BFB297) ;-)
2. the number of characters displayed

Thanks,
Jim KC9HI

Would love to test channel names…been waiting for CHIRP support on this one….

I've got a Pofung BF-F9+TP which downloads as a UV-5R but won't upload with today's latest CHIRP due to "unsupported firmware version: 'N5R3401BFP3-25XX".

Firmware Msg 1 N5R3401

Firmware Msg 2 BFP3-25

Poweron Msg 1 141023N

You need to use the BF-F8HP option in CHIRP as it is a F8HP variant and not a 5R variant.

Greetings Jim, I just received another BF-F8HP last week from BaofengTech.com which linked to Miklor.com which linked to Amazon. This one has N5R3403 firmware, and I have several channels with 7-character-names programmed and 7 characters displayed.

This one has some difficulty accepting the 3800 mAh batteries that fit all the others.

Strange…I never download the standard CHIRP but that's what I had on my Windows 10 computer (I recently changed moved CHIRP to that one) for some strange reason (after I checked the "About" box). Musta' had a brain fart when I installed it.

Got the 20150325 and all is well. Thanks for slapping me in the face to check the version#.

I'll confirm that N5R3401 BFP3-25 shows all 7 chars for channel names.

Depends on how you look at it. In ASCII char-by-char the answer would be 2 or -2. So this doesn't answer the question from the Hitchhiker's Guide.

U=85

S=83

B=66

If you treat is a 4-byte integer MSB order you get 131,072 or -131,072

USB = 0x555342

SSB = 0x535342

If you treat it as a 4-byte integer LSB order you get then answer of 2 or -2 again.

USB-0x53420055

SSB=0x53420053

Oh Mike! I got a real good laugh out of your response. Took me 5 minutes to compose myself to respond. Kudos.
Now to answer the question. Single Side Band is the generic term. USB and LSB are SSB modes.

I've seen a number of posts where UV-5R xcvrs that were programmed with Chirp suddenly had squelch issues. My new radio arrived from Amazon yesterday with the same problem - even with the squelch set to 0 there is no reception unless the button on the side of the radio is depressed.

I should be getting my programming cable today and hopefully the procedure to fix the squelch issue will work. I was just curious if anyone else had recently received a new radio that had the squelch issue right out of the box.

Try Menu 8 -> On. If reception occurs then your new radio has a firmware
version with the "beep bug".

Already tried that. Beep option on or off, still no reception.

Of course without the cable I can't determine the version of the firmware I have, but - UPS willing - I'll have a cable this afternoon.

Thanks for the suggestion though.

And if it has the BEEP bug, which it may have, then it has been
sitting in someone's warehouse for 8 months, because the bug was fixed
last September.

we bought two 'HERO' units from Baofeng Radio here in the UK, the so called 2015 model with the new chipset

http://www.baofengradio.co.uk/

One is deaf and the other one is fine. We are jumping through hoops now to get the deaf one returned. They want a video now to demonstrate the problem.

Beep is turned on... so it isn't the 'beep bug'

KC,

Download from it using CHIRP. Email the image file to me and I will be able to tell if an incompatible image has been uploaded to it. If one has, then this radio was probably a return.

If you can't get it returned, it can probably be easily fixed using
CHIRP and the correct "factory" image file.

The article didn't cover it, but my understanding is that not only does the LMR-450G cable have lower loss as the frequency increases, it also has lower loss as the length increases. So you probably wouldn't want to use it for short runs or jumpers.

It took a couple of attempts (first time using CHIRP) but the squelch problem was resolved using the CHIRP recovery procedure at miklor.com. All is well! And with a $6 cable from Amazon (must have got lucky with that one).

Now I can play with my new toy. Thanks for all the helpful hints and suggestions.

73,

KC, w0vp

That extra antenna has a knife , fork and spoon attachment too. Like
a Leatherman utility tool.

Just need to insure you use an SMA F knife adaptor on it.

I just wanted to make sure you didn't think they were the same because
they both report BFB297 during power up while the [3] key is pressed.
Yes, if you can download from both radios into CHIRP and CHIRP shows
that they both have N5R-219 firmware, you can use the CHIRP Radio
Image file of the working radio to "fix" the radio with the squelch
that won't open.

There were NO Baofeng dual-band mobiles shown at IWCE, and the Baofeng UHF mobile appears nearly identical to the TYT TH-9000, so "if" Baofeng does release any new mobile radios, they would appear to be copying the already existing TYT products.

Probably quite true, Tony.

IWCE is a fun show to visit, if you go at a reasonable pace and don't stay too long with any one vendor you can get through it in two days with enough time left over to re-visit some of the more interesting vendors. Of course the large commercial vendors dominate the show, but you can find a few surprises if you look very closely. Several of the vendors (not Baofeng) hinted very strongly that newer models (not yet on display) would be announced shortly after the show.

One surprise was stopping by the actual Baofeng booth and seeing the surprised looks on their faces while looking at my various Baofeng products attached to my belt (or bag). Neither the BF-F8HP nor the BF-F9V2+ radio was on display and all three reps tried (in very bad English) to tell me these were "one off or special builds" made for specific dealers, not "normal" (their words - not mine) Baofeng radio models.

After moving down the row, I chuckled at the thought of their difficulty in seeing their own company's decision to make various special production run radio lines that they clearly had not seen before. No wonder folks new to radio have issues with dozens of different models on Amazon, E-Bay, or various Chinese based websites all claiming to have the "newest" models.

The radio is a Clone of the Baojie, TYT 9000 and Zastone MP600

Actually it is a good radio, design wise. I have a large number of them both TYT and Zastone versions. The TYT versions are 220 mhz power output on all of the is around 65 W (except the UHF version runs cooler)

The Zastone MP600 has a voice inversion module in it . Both have 5 DTMF and 2 DTMF controls with stun, kill and suspend commands and a scan look back control. Also a few other goodies.

The heat sink on it and body construction makes it a really heavy duty workhorse for portable Go-Box use.

That is why we picked them for the boxes. The only really downside is the Single band issue while quad bands are out now not much higher in price.

They also have a repeater kit that comes with a duplexer and a rack mounted interface with a data control line nice heavy duty ground plane repeater antenna and cable.

No idea if the Baofeng mobile will be exactly the same in the guts, but on the outside and per specs looks the same.

Programming is done with the RTS TH9000 programmer the factory programming is not as bad as some of them either.

We have been told the interest and sales on the Baofeng mobile has been very low. Expect possible discounts to clear them if they do not sell well.

Interesting Baofeng reps actually do not know what is going on, I have posted what I have been told about Baofeng through the Chinese end grapevine so does not surprise me. I can reiterate that along with Apple electronic sweatshops FoxCom (had to install suicide prevention nets in the dorms because stressed workers jumped off the top floors) Baofeng is right up there.

The only thing maybe cheaper than how they treat their workers (per numerous reports) is to use prison labor. That is one reason they can keep costs really low.

I'd be really suspicious of ANY repeater that is assembled
from mobile radios - for two reasons:

1, the transmitter.
Very, very few have enough duty cycle to survive when the
transmitter is keyed for an hour or more. you don't need a
disaster scenario to burn it up, the local ARES net here can
run for a couple of hours, what with the Newsline playback,
the roll call, a report / summary of the last general meeting,
and the lessons-learned discussion of the last event.

2, the receiver.
The average mobile receiver typically is very wide (136-174
MHz, or 400-520 MHz, anybody?) whereas a repeater needs
to be tuned to ONE channel. Also the specs (and performance)
are very loose on how well it ignores local strong signals - and
both parameters are not something you want in a repeater
receiver. There are reasons that the Motorola Micor, MSF,
MSR and GE equivalents all have multiple tuned circuits in
the receiver front end.

If you want to build a repeater then start with a repeater
grade radio.

Recently this was proved yet again with the Icom D-star
"repeaters" that were nothing more than two mobiles and
a $50 duplexer in a pretty box and coupled to a controller
board.

Some of the DMR repeaters are built the same way.

Yes, Moto has the GR series made from two mobiles, but
they are specifically marketed to low duty cycle applications
like shopping mall housekeeping where you hear calls like
"spilled ice cream cone pickup in front of the Target store" .

James,

They are portable units and Zastone makes them, they are for low duty cycle use though

Model is RP600

Not much info on them on the English speaking side. I got one unit in and it went out the same day before I had a chance to mess with it.

For temporary duty, I have built number of repeaters from commercial land-mobile mobile radios and they have worked just fine. "Temporary duty" in this case is a few days, less than a week, and far short of continuous duty.

By "commercial land-mobile" I am referring to decent quality products by Motorola, Kenwood, Icom, etc., not to low end "ham quality" mobiles. These typically have decent front ends on the receivers, combined with a decent duplexer (not a $50 Chinese special) I have not experienced problems even in high RF environments.

It's not fair to lump all mobiles together as not suitable for use in a temporary repeater environment. Even for a permanent repeater if the duty cycle is acceptable. More often than not, the main difference between a continuous duty and partial duty rated transmitter is the heat sink and cooling.

Of course Mike is correct when he asserts that repeaters with higher duty cycles need to be designed for that, but many hams use various mobiles for cross band use and so long as they understand the need for better than normal cooling, no long term 30 minute plus continuous keydowns, and having the radio set to medium (or lower) power levels - they "normally" work quite well.

We have used various TYT and Wouxun units for SAR activities (as well as normal camping trips) with no problems at all - but we followed the example above - no long term keydowns, only 5 to 10 watts of output power, and we had an additional larger fan running over the heatsink area of the radio. I haven't tried TYT's repeater in a box (yet), but I may add one to our next order to experiment with.

Rich,

The Zastone RP600 looks exactly like the TYT version (no surprise there, eh?). Was your unit set up for VHF or UHF?

While I tend to agree with your concerns, there are many repeaters in service (both ham and commercial) that are really nothing but a couple of mobiles with a controller board.

> Yes, Moto has the GR series made from two mobiles, but

I think you are putting too much faith in the notion of Motorola having their largest selling repeater "specifically marketed" to low duty cycle applications. Yes, traditional commercial radio shops dealing with local customers will ALWAYS try to up-sell (regardless of the likely duty cycle), but there are still a LOT of those Moto boxes running happily for customers who have no clue what is inside the box. The poor quality of the duplexer provided in the Moto box is more likely to cause problems than the duty cycle.

Thanks for the info. Will hold off on making the purchase. Another reason is even though it is being sold through Amazon, it isn't being shipped by them, That gives me pause before ordering it.

Bruce

Subject: Re: [baofeng_uv5r] new uhf mobile

The radio is a Clone of the Baojie, TYT 9000 and Zastone MP600

Actually it is a good radio, design wise. I have a large number of them both TYT and Zastone versions. The TYT versions are 220 mhz power output on all of the is around 65 W (except the UHF version runs cooler)

The Zastone MP600 has a voice inversion module in it . Both have 5 DTMF and 2 DTMF controls with stun, kill and suspend commands and a scan look back control. Also a few other goodies.

The heat sink on it and body construction makes it a really heavy duty workhorse for portable Go-Box use.

That is why we picked them for the boxes. The only really downside is the Single band issue while quad bands are out now not much higher in price.

They also have a repeater kit that comes with a duplexer and a rack mounted interface with a data control line nice heavy duty ground plane repeater antenna and cable.

No idea if the Baofeng mobile will be exactly the same in the guts, but on the outside and per specs looks the same.

Programming is done with the RTS TH9000 programmer the factory programming is not as bad as some of them either.

We have been told the interest and sales on the Baofeng mobile has been very low. Expect possible discounts to clear them if they do not sell well.

Interesting Baofeng reps actually do not know what is going on, I have posted what I have been told about Baofeng through the Chinese end grapevine so does not surprise me. I can reiterate that along with Apple electronic sweatshops FoxCom (had to install suicide prevention nets in the dorms because stressed workers jumped off the top floors) Baofeng is right up there.

The only thing maybe cheaper than how they treat their workers (per numerous reports) is to use prison labor. That is one reason they can keep costs really low.

I'd be really suspicious of ANY repeater that is assembled
from mobile radios - for two reasons:

1, the transmitter.
Very, very few have enough duty cycle to survive when the
transmitter is keyed for an hour or more. you don't need a
disaster scenario to burn it up, the local ARES net here can
run for a couple of hours, what with the Newsline playback,
the roll call, a report / summary of the last general meeting,
and the lessons-learned discussion of the last event.

2, the receiver.
The average mobile receiver typically is very wide (136-174
MHz, or 400-520 MHz, anybody?) whereas a repeater needs
to be tuned to ONE channel. Also the specs (and performance)
are very loose on how well it ignores local strong signals - and
both parameters are not something you want in a repeater
receiver. There are reasons that the Motorola Micor, MSF,

MSR and GE equivalents all have multiple tuned circuits in the receiver front end.

If you want to build a repeater then start with a repeater grade radio.

Recently this was proved yet again with the Icom D-star "repeaters" that were nothing more than two mobiles and a $50 duplexer in a pretty box and coupled to a controller board.

Some of the DMR repeaters are built the same way.

Yes, Moto has the GR series made from two mobiles, but they are specifically marketed to low duty cycle applications like shopping mall housekeeping where you hear calls like "spilled ice cream cone pickup in front of the Target store" ..

Yep

Looks like exactly the same.

The one they got was VHF.

I am thinking of getting one for a remote cabin area and set it up for off the grid use. If needed, it could be set at low power and operated to give back wooded area coverage (phones sporadic)

Will rig the identifier into it.

The price you cannot beat which included the antenna, duplexer and cable LMR400.

If I get my own version I plan on running in L power too (which really is not that L) but should not have a heat issue compared to 65W

Too bad they came and grabbed it before I could even fool with it.

We don't particularly want foreigners coming here buying items which are especially made for use here. In any case they would not work in the Northern Hemisphere. They would work backwards and upside down, thus all signals would be reversed.

Graham, VK7GD.

The reverse spin issue has been hacked already here in the states. Locate the FrAZMatz oscillator (Frequency Adjusting Impedance Matrix) and swap polarity on pins 1&16. This will alter the oscillation through the phrouban interface.

Hi Guys,
Sorry I haven't been able to post for a while.
I did read a few and wanted to know why you want to key up a repeater for and hour?
Also when we did (SAR) in the pine lands here in NJ,450 Mhz was the pits.
Turned out that the pine needles full of sap were sort of a 1/4 wave to the 440 band.
We had 2 meters linked to a 220 machine and another 2 meter repeater linked to a 440 machine.
I think I missed a lot of post on the cross banding.

James,

The thread was about using two mobile rigs as the basis for a low power, low duty cycle repeater. Rich and I were just tossing our thoughts back and forth between his Zastone RP600 and the TYT unit (which appears identical at first glance). Most of the time I end up just using a cross-band mobile rig for what I need while camping or during SAR activities, but it sometimes would be nice to have an in-band repeater as well (for those times when someone in the group only has one band for example).

As you said, not much information online in English, I've see prices from low 400 neighborhood to well north of 800.

You mentioned LMR400 cable, but Zastone's own page says it comes with RG8U cable http://www.zastone.com/Public/Uploads/attach/1394427581.jpg

> If I get my own version I plan on running in L power too (which really is

It would be interesting to see more of the design. From what I could see in some online pix of the mobiles, the mobile case seems to be one giant heatsink, with no fan. That seems adequate for a 65W mobile even in moderately high duty cycle use so long as there is room for air to flow around it and the ambient temperature isn't excessive.

The pix of the repeater seem to have two mobiles stacked on top of the AC power supply, all wrapped in a metal box, but I haven't seen any pix that show the back of the box. From the angled views it seems there ought to be enough depth for them to have included a fan but it still seems that airflow would be a potential problem area. A little surgery on the case might be worthwhile.

Maybe but first you need to adjust the orthomode transducer in the parametric amplifier section using reverse bias on the pin diodes

I had Lmr 400 substituted per the US Army reserve request, basically Zastone will try to include whatever cable you would need. It was not marked Times Microwave though it was an equiv import cable version that charted with the same loss attenuation specs as 400 though. <suggestion if you get one do not ask for the cable to be included as this was a weight issue $$$ being sent DHL- lesson learned>

The back had a huge fan, at the bottom the duplexer sat. The power supply regulators also had a fan on them too.

Actually I found pictures I took of it will post below.

Not much info on it some English case studies from Chinese universities and businesses that solved their comm issues with it, some use in Russia. The USA reserve still has it sitting there and I might go and assist with a few things and hope to play with it. They are looking for a GROL holder to assist- which I will do for free. Hope they will put it online, to see how well it works.

Prices do run 500 to 800 depending on cable and other options, actually not a bad deal compared to what is on the market., Easily programmed with software I use the RTS TH 9000 package. You can also use as a regular station at the control point too. What I got including shipping express, was close to 700.

I do know the mobiles (MP600) are good have a few of them and they work well in the hot sun here- no issues with signal quality either. Just wish I had time to turn it on and play with it to make a more solid recommendation. It is light enough to be one hand carried and easily back packed However running with it in combat boots – I would pass on that

Let me know if the pictures do not come out- will send off group- also contact me off group if you want the sales contact info

Have seen uv-5r setup this way with (the linkbox?) or allstar on a small rasberry pi or beaglebone black
Makes a great EMCOMM setup.
Mobile repeater and a wifi link to a cellular based hotspot so could run echolink. Antenna seperation and a 12v amplifier and makes sommething tHat could stay in the truck. Also standalone the setup using UV-5R frequency agility it could assist other agencies with radio communicaTions in areas of spotty service.

If this is for an in-band repeater, you definitely do NOT want to use
LMR400. This has been discussed ad nauseam on the Repeater-Builder group:
LMR400 eventually causes desense due to RF current flow between the
dissimilar metallic braid & foil shields.

"Virgin" RG-8/U cable will work, but as soon as the braid begins oxidizing, it too will begin to generate desense. BTDT.

The only good flexible cable that's suitable for duplex use has silver-plated braid. RG-214 (real RG-214, not the cheap stuff labeled "RG-214 TYPE"), RG-393, RG-400 & RG-223. Of course there's also "Superflex", but that's not really flexible compared to the braided coax cables.

I think they were going to run UHF then changed their minds to use as a VHF unit after the LMR400 was ordered.

I suggest to anyone wanting to buy something like this repeater, the cable was heavy and it would have been cheaper to buy local this component after shipping costs it was around 50 cent a foot higher.

Or make sure that your flux capacitor is properly mounted using enough velocity factor grease.

[image: Inline image 1]

Of course, spreading a light dose of velocity factor grease on your new LMR-450 coax will also help remove any amount of signal loss on coax runs over 200 ft. in length. No sense losing any of that 1.21 gigawatts of power if you don't need to!

Hint - it's also handy to be able to jump back in time and work those rare countries for DXCC when you already know when and where they will be on the HF bands, but "some" folks might argue that's "cheating", but that's another discussion altogether.

Everyone's making it way too complicated. What are you guys, engineers? It's much simpler than everyone is making it. Turn the battery upside down, and reverse the polarity, + to -, and - to +. And it you have problems with reception, point the antenna down instead of up. All will be good. An alternative is to tilt your head to the left, and the radio to the right, but OSHA frowns on such neck strain. Oh wait... maybe that head tilted right, and radio to the left. Ken, WB0OCV

The pictures came out great. Thanks.

Looks like it could be really useful in some situations.

Love to know more about the real world performance of the duplexer (I suspect that it is much like the one Moto supplies in their box, adequate to keep the transmitter out of the receiver but not enough for the crowded RF environment common at a site shared with other repeaters)

I'm curious whether the big fan blows in or out and what sort of airflow it actually achieves since it seems that the radios are boxed in on all other sides. I've seen problems in computers with great fans but poor airflow. Only the transmitter would be a real concern for cooling under most conditions.

Personally, my interest is mostly academic (I have one of the Moto boxes sitting here (which is definitely NOT a one-handed carry)) but I like to keep up with what is available especially at the low end of the price range.

Subject: Re: [baofeng_uv5r] Re: RP600

I had Lmr 400 substituted per the US Army reserve request, basically Zastone will try to include whatever cable you would need. It was not marked Times Microwave though it was an equiv import cable version that charted with the same loss attenuation specs as 400 though. <suggestion if you get one do not ask for the cable to be included as this was a weight issue $$$ being sent DHL- lesson learned>

The back had a huge fan, at the bottom the duplexer sat. The power supply regulators also had a fan on them too.

Actually I found pictures I took of it will post below.

Not much info on it some English case studies from Chinese universities and businesses that solved their comm issues with it, some use in Russia. The USA reserve still has it sitting there and I might go and assist with a few things and hope to play with it. They are looking for a GROL holder to assist- which I will do for free. Hope they will put it online, to see how well it works.

Prices do run 500 to 800 depending on cable and other options, actually not a bad deal compared to what is on the market., Easily programmed with software I use the RTS TH 9000 package. You can also use as a regular station at the control point too. What I got including shipping express, was close to 700.

I do know the mobiles (MP600) are good have a few of them and they work well in the hot sun here- no issues with signal quality either. Just wish I had time to turn it on and play

with it to make a more solid recommendation. It is light enough to be one hand carried and easily back packed However running with it in combat boots – I would pass on that

Let me know if the pictures do not come out- will send off group- also contact me off group if you want the sales contact info

> The price you cannot beat which included the antenna, duplexer and cable
> LMR400.

As you said, not much information online in English, I've see prices from low 400 neighborhood to well north of 800.

You mentioned LMR400 cable, but Zastone's own page says it comes with RG8U cable http://www.zastone.com/Public/Uploads/attach/1394427581.jpg

> If I get my own version I plan on running in L power too (which really is
> not that L) but should not have a heat issue compared to 65W

It would be interesting to see more of the design. From what I could see in some online pix of the mobiles, the mobile case seems to be one giant heatsink, with no fan. That seems adequate for a 65W mobile even in moderately high duty cycle use so long as there is room for air to flow around it and the ambient temperature isn't excessive.

The pix of the repeater seem to have two mobiles stacked on top of the AC power supply, all wrapped in a metal box, but I haven't seen any pix that show the back of the box. From the angled views it seems there ought to be enough depth for them to have included a fan but it still seems that airflow would be a potential problem area. A little surgery on the case might be worthwhile.

I think they were going to run UHF then changed their minds to use as a VHF
unit after the LMR400 was ordered.

I suggest to anyone wanting to buy something like this repeater, the cable
was heavy and it would have been cheaper to buy local this component after
shipping costs it was around 50 cent a foot higher.

If this is
for an in-band repeater, you definitely do NOT want to use
LMR400. This has
been discussed ad nauseam on the Repeater-Builder group:
LMR400 eventually
causes desense due to RF current flow between the
dissimilar metallic braid
& foil shields.

James

Best to check what is listed on Google, as I have paper brochures. Some stuff is in Chinese

Google rp600 repeater as you want to sift through all the sites to get a clear picture of specs and capabilities. Most listings online are alibaba stuff.

James looks the same as the TYT and Zastone versions. Prices all around the same area. I sell the Zastone version (goes to 490 mhz) with the Inversion Scrambler mod + software + cable + fully programmed + tax for $190

Plus the Zastone UHF version is 55Watts too

Prices run for these clones $130 to $200+ depending on options.

If anyone has one it would be interesting to get an op report on it.

The problem is the die-hard Baofeng types I deal with do not want to pay more than $50 for anything. I got a lot of complaints about the BF F8+ HP’s costing $60 or the A58’s costing $70.

People would want this if around $50-$80

Baofeng has placed itself in the cheapest of cheap customer base that will balk at any price not discounted by wide margins.

To answer your question, Baofeng will offer a mobile VHF version radio when:

a) they can negotiate a deal with another Chinese company to re-label their radio under the Baofeng/Pofung name, and
b) sales of the Baofeng UHF mobile are enough to justify the hassles encountered in step a

As far as the "new" portion of the previous statement, many of us knew that Baofeng was bringing out a mobile rig for months, in fact it was discussed back on April 16, 2014 on Hans blog:

https://hamgear.wordpress.com/2014/04/16/muddying-the-waters-pofung/

Pergear clean kit are a pair of gloves for cleaning things, like displays. I looked over the Amazon website. Doesn’t say they ship it yet, ships from another company. Doesn’t say what type of antenna connector you need.

Thanks. I know my old Icom I needed to order a adapter. Off the top of my head I forget what type connector. If I do order the radio, I want to order the appropriate adapter connector too, just to be sure. I hate to order the radio and get it and cant use it.

I also wonder about programming. I don’t need to program 200 channels, just a couple. I hope programming is easier then the baofeng ht. I guess I am too old school when it comes to programming these things ;)

Problem is most of the Baofeng crowd expect the mobiles to be around $30 bucks too.

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] New Baofeng Mobile Tranceiver

To answer your question, Baofeng will offer a mobile VHF version radio when:

a) they can negotiate a deal with another Chinese company to re-label their radio under the Baofeng/Pofung name, and

b) sales of the Baofeng UHF mobile are enough to justify the hassles encountered in step a

As far as the "new" portion of the previous statement, many of us knew that Baofeng was bringing out a mobile rig for months, in fact it was discussed back on April 16, 2014 on Hans blog:

https://hamgear.wordpress.com/2014/04/16/muddying-the-waters-pofung/

James looks the same as the TYT and Zastone versions. Prices all around the same area. I sell the Zastone version (goes to 490 mhz) with the Inversion Scrambler mod + software + cable + fully programmed + tax for $190

Plus the Zastone UHF version is 55Watts too

Prices run for these clones $130 to $200+ depending on options.

If anyone has one it would be interesting to get an op report on it.

The problem is the die-hard Baofeng types I deal with do not want to pay more than $50 for anything. I got a lot of complaints about the BF F8+ HP’s costing $60 or the A58’s costing $70.

People would want this if around $50-$80

Baofeng has placed itself in the cheapest of cheap customer base that will balk at any price not discounted by wide margins.

If it is a real clone, the factory software is good enough especially for a few channels.

These radios should be N type connectors but...

If this is a clone and you want a large amount of programming capability use RTS TH 9000
However, I would not buy it until reports come out the software is same as the TYT.

I have had lukewarm responses from people looking to buy a mobile.

1. Fact it is single band
2. Cost has been a complaint too.

Wonder how well this model will do. Hopefully well so they expand their design into more mobile products.

Thanks. I know my old Icom I needed to order a adapter. Off the top of my head I forget what type connector. If I do order the radio, I want to order the appropriate adapter connector too, just to be sure. I hate to order the radio and get it and cant use it.

I also wonder about programming. I don’t need to program 200 channels, just a couple. I hope programming is easier then the baofeng ht. I guess I am too old school when it comes to programming these things ;)

You can see the antenna connector in the rear view photo. It kinda looks like a type N but it must be SO239. I can't imagine a Type N on this type of radio.

A Type N is what you want on a UHF system.

http://www.qsl.net/vk3jeg/pl259tst.html

As this analysis shows a PL-259 suffers around an -8 dB return loss at 432Mhz compares to a Type N with around -34dB.

And the N also has constant reverse reflection impedance across a wide range whereas the PL259 is "non constant" much above 50MHz.

Can a delay be programmed in for the UV-5R so that it will stay on a channel that becomes active prior to it resuming the scan? Right now when I scan all of the repeaters in my area, and then I hear someone throw out a call-sign, before I can pick up my mic and respond it has already resumed scanning.

I would like to set about a 5 second delay prior to scan resumption. Any help would be much appreciated.

The short answer is... Yes.

The UV-5R and variants scan between the band limits. So you would use CHIRP or the OEM VIP software to alter the band limits to the range that you want to scan.

The smallest increment for the low and high band limits are 1 MHz and the high band limit covers that whole 1 MHz range.

So using your example of wanting to scan from 420 MHz to 430 MHz, you would set the low band limit to 420 and the high band limit to 429. This would scan the range from 420.0000 MHz to 429.9975 MHz in based on the frequency interval determined by the STEP setting. Once scanning reached 429.9975 MHz, it would wrap around and continue scanning from 420.0000 MHz.

You might want to think about getting a scanner.

You might try looking at the menus. There you might fine Menu 18 - SCAN RESUME METHOD

If you can find the menu and can find menu 18, then you might find SE (Search Operation) Scan stops when signal detected. Scanning will not resume.

OR you could go to the Miklor website (link at the bottom of every message in this forum) where you would find all the information about this radio.

There are many areas of the country where the UHF 30 MHz wide band plan has

many more repeaters than the VHF 4 MHz wide band plan. Of course, your
area may differ. I suspect that Baofeng is marketing a UHF radio first
since that's the better deal that they got from the actual manufacturer
making it for them.

Wrong market James. VHF is in greater demand among ham radio operators in North America. UHF is in far greater demand among commercial users -- who are buy far more radios and who are likely to look for the low bidder.

I reckon that for the antenna connector at the back of the radio, and also a connector at the base of the antenna itself, the S0239 is OK, even for 70cms. Connector quality, and insulation will come into it of course.

The radio will be designed, (tuned) to give its power out to the coax, and also to make best of what it receives from that coax, via the connector. (ditto antenna). The connector will have an effect if it has a return loss, but the radio circuits will be compensating for it. That is to say, the radio will present max output into the coax regardless of the socket, if correctly designed.

On the other hand, once it has got out of the radio and into the coax, then only quality connectors will suffice. I even use "N" types on HF, although that is more of a mechanical/waterproofing consideration.

To get an different idea of what I mean, imagine a small metal plate to which is attached an coax socket of some sort. The centre pin of which is connected to a simple quarter wave for the band in use, and the metal plate providing somewhere to connect the ground planes. Any type of socket will do, although weatherproofing and physical strength will come into it.

In short... Don't worry about the radio or antenna connectors, but forget S0239/PL259 combinations to join coax. And best of all, use one continuous length! :-)

But... To keep things OT, any type of external antenna for a UV5R, (and probably most of its variants) is unwise.... And cheap Chinese mobiles may also not be a good choice for a base station...

YMMV,

73 de Stan, G4EGH

That's pretty amazing that a single connector type change at the transceiver could have that much effect. Yet you rartely see it on vhf/uhf mobiles. At least most of the ones I have seen which are the under $300 variety which may be why.

A Type N is what you want on a UHF system.
http://www.qsl.net/vk3jeg/pl259tst.html http://www.qsl.net/vk3jeg/pl259tst.html

As this analysis shows a PL-259 suffers around an -8 dB return loss at 432Mhz compares to a Type N with around -34dB.
And the N also has constant reverse reflection impedance across a wide range whereas the PL259 is "non constant" much above 50MHz.

You can see the antenna connector in the rear view photo. It kinda looks like a type N but it must be SO239. I can't imagine a Type N on this type of radio.

My radio refuses to save any setting i make for the PTT-ID option, no matter if i select BOT EOT or BOTH when i save and exit and then go back into menu, its still on off.

Same if i use CHIRP and change it under DTMF settings; ANI-ID, and then upload to radio, it is still OFF in the radio...

As if "write protected"? :(((Anyone know why?

From: Jim Unroe
Topic: 49650 Message: 49651

Even though the menus let you go through the motions, you cannot edit memories from the keypad. You must erase the memory and program it again from scratch with the new settings.

PTT-ID and ANI similar but not the same thing. ANI is global, PTT-ID is per channel. You want PTT-ID, not ANI.

You access the PTT-ID settings by highlighting the memory row, press the [Properties] button and then select the Other tab.

If you want an explanation of how to setup PTT-ID and ANI, go to the RadioReference forums and search for my post where I explain it. (normally I would provide the link but I am not in a position to search for it myself for several hours).

Connect the cable before you start the program. This is a well known issue when the software cannot find ANY com ports because you have not connected the cable (which opens a com port) and modern computers don't have any hardware com ports.

Is it legal for unlicensed operators to use an amateur repeater?

There just might be a way.
In Australia the 70 cm repeater inputs are in an LIPD band.
So anybody may transmit voice with CTCSS code on the input
of a 70 cm repeater with up to 25 mw ERP, and no license is needed to
listen to the output of the repeater.

What would be the ACMA's response to people exploiting that loophole?
What would be the response from licensed amateurs?

49661. UV5R and APRS

Yahoo group: baofeng_uv5r (2015)
Date: 2015-04-15 17:25:55 UTC
From: mbonath@...
Topic: 49661 Message: 49661

Hello,

I have connected my old UV3r with the soundcard and using soundmodem for APRS.
On the TRX Vox is activated and it works perfect. The UV3R is the first version with the 3,5mm triple jack so ihave to made another when i want to use a UV5R instead of the old UV3R.

For the UV5R input i have a cable with 2,5mm and 3,5mm jacks, both are stereo.
The TRX is set to Vox but it will NOT transmit even when i play a sound an the pc.
The same setup (with the 3,5mm tripple cable!) works with the UV3R without a problem, if there is a sound the TRX goes to TX.

So i took another UV5R and there is the same problem, no TX.

Finally i made the Repeater Setup for testing like it is decribed here:
Cross Band Mini-Repeater Project UV5R UV82 http://www.miklor.com/COM/UV_CrossBand.php

http://www.miklor.com/COM/UV_CrossBand.php

Cross Band Mini-Repeater Project UV5R UV82 http://www.miklor.com/COM/UV_CrossBand.php
Baofeng Pofung UV5R UVB5 FAQ Drivers Software Accessories

View on www.miklor.com http://www.miklor.com/COM/UV_CrossBand.php
Preview by Yahoo

The TRX with Vox on goes instantly to TX when the Cable is put into the other UV5R

How must the cable looks between the UV5R and an audio source ???

49662. BF-F8hp DCS settings

Yahoo group: baofeng_uv5r (2015)
Date: 2015-04-15 21:59:44 UTC
From: brian@...
Topic: 49662 Message: 49662

I have a bf-f8hp radio and for most of what I am using it for it works great. Has great range but I found a frequency that I cannot use because the DCS is not right. On one radio I pulled the settings and found out that the channel has the DCS code of D125N on both the TX and RX. I crossed reference that setting for my radio and it it 21 the problem is that on the radio the lowest setting is 23. The firmware version that I am using is N5R-30

Is there a way I can get to that setting?

My BF-F8HP has D125N available on both DCS transmit and receive. If accessing from the keypad, try Menu 10 and Menu 12 to adjust, but remember you'll need to delete any prior memory on that channel and re-enter the info from scratch.

IC. the numbers are only short cuts and those short cuts are not included in chirp but they are in the radio.

I can get it to work only once. Meaning I put in the T-DCS and R-DCS come out of the menu and then I can transmit to the other radios but as soon as I go off of the channel and then back on to it the DCS settings are not saved. I have deleted the channel from the radio then entered in the Frequency, offset, T-DCS, R-DCS then assigned it to a channel. I have only the frequency showing on the front of my radio. As long as I do not move off of that frequency I can use the channel for any reason like scanning or dual watch the DCS settings get lost. There has to be something that I am missing as to why they not saving in the radio??

Thanks for helping.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

Brian,

I think you may just be misunderstanding these settings. D125N is just
the 21st selection of 105 possible standard DCS Normal polarity codes.
There are also 105 possible standard DCS Inverted polarity codes. The
21 by itself means nothing. It is the 125 and the N that is important.

Here is a link to the "Reference for BF-F8HP Menus" and at the end is
a chart of the DCS codes.

Brian,

Look at menu 27 (MEM-CH) in that the guide that I provided the link for in my previous post. It lists the 9 menu settings, including menu 10 (R-DCS) and menu 12 (T-DCS), that are stored on a per channel basis.

Once a channel is programmed, these 9 menus cannot be changed from MR (channel) mode (even though the menus will let you go through the motion of doing so). I'm even surprised that you can even get this to work once. Baofeng had apparently made a change to allow these settings to be temporarily be changed?

In any cast, to permanently make this change, you either have to erase each channel and reprogram it from VFO (frequency) mode or you must update it using programming software.

I find the same thing on my UV-5R, but you can inter the D125N by pressing, 'MENU' and '12' this well take you to the 'T-DCS' Menu now press 'MENU' then press 21 & 'Menu' + 'Exit.'.

Here are two really wild ideas that you might try:

1) Read the FAQ and the programming instructions

and

2) Go to the Yahoo Group website where the past messages are archived; pick any 10 messages at random to read; odds are very good that one of those random messages will include the phrase "but as soon as I go off of the channel and then back on to it the ____ settings are not saved."

49669. BL-5L latching

Yahoo group: baofeng_uv5r (2015)
Date: 2015-04-16 15:18:50 UTC
From: Roger Elmore
Topic: 49669 Message: 49669

Does anyone have any tips on how they got their BL-5L 3800mAH battery to latch into their UV-5R?

I have two UV-5Rs. One came with the standard battery and I purchased a BL-5L for it from R&L. The second came direct from a China seller with only a BL-5L. Both 3800mAH batteries have Baofeng labels on them. Neither will latch into either radio like the standard battery does. It appears the batteries can't slide up far enough to securely latch.

I checked the Miklor FAQs and only saw the issue of batteries being hard to remove. I tried a search in this group's archives but came up null. I haven't used the radios much other than to program them and I'm trying to avoid the embarrassment of having to stop and pick up the battery when I finally do clip them on my belt. Any hints before I file off more plastic than I need to are welcome.

Thanks!

Well I hooked up the radio and cable up and the shuttering ceased. Now I get an error 8020 comm error. Any other ideas? Do I need to reload the driver again?

Thanks
Joe

I guess I'm just going to have to get good at keyboard programing. The error message went away, now I'm back to the flickering display. The cable seems to be recognized by the computer because it makes some tweedling (for lack of a better description) when I plug it in and remove it.

Don't give up on me yet. I am appreciative of the help so far.

Thanks

Joe

Joe, (like many others before you) probably have purchased a fake Prolific cable, which is why you are having so much trouble. And no, it doesn't matter a bit if your cable says "Baofeng" on it or not, there's still a 95% plus chance you have a fake Prolific chip inside your programming cable. Follow the well documented instructions (on the bottom of every email) on how to roll-back your current Prolific driver to an older version (one that doesn't check to see if you have a fake cable and stops working).

From: mbonath@...
Topic: 49661 Message: 49682

Hm, maybe i wrote it to complex, l itry it again:

I tryed an ordinary audio cable (stereo) with 2,5mm and 3,5mm jack. Cable is straight forward, tip to tip, ring to ring, and sleeve to sleeve.

If vox is activated and i play a sound on the PC the UV5R does NOT transmit.

The question is: How to setup a cable between UV5R mic in and soundcard speaker out ?

From: Eb Klemens
Topic: 49669 Message: 49685

Mine were that way also. I found that if I just give them a hard slam as I slide them in they latch.

1a. BL-5L latching
Posted by: "Roger Elmore" relmore@... mambm2002
Date: Thu Apr 16, 2015 8:18 am ((PDT))

Does anyone have any tips on how they got their BL-5L 3800mAH battery to latch into their UV-5R?

I have two UV-5Rs. One came with the standard battery and I purchased a BL-5L for it from R&L. The second came direct from a China seller with only a BL-5L. Both 3800mAH batteries have Baofeng labels on them. Neither will latch into either radio like the standard battery does. It appears the batteries can't slide up far enough to securely latch.

I checked the Miklor FAQs and only saw the issue of batteries being hard to remove. I tried a search in this group's archives but came up null. I haven't used the radios much other than to program them and I'm trying to avoid the embarrassment of having to stop and pick up the battery when I finally do clip them on my belt. Any hints before I file off more plastic than I need to are welcome.

Thanks!

The problem with the "hard slam" method is that sooner or later you'll break off one or two of the tiny little plastic tabs on the bottom of the radio and then have issues getting the battery to stay in place. We usually see one or two radios a month that are missing their plastic tabs with owners complaining about keeping the battery in place.

From: mbonath@...
Topic: 49661 Message: 49688

Ok, youre right, my desription was wrong. Of course the 2,5mm is the speaker, thats what i never will understand why Kenwood has done this...

And of course i used the 3,5mm for the Input in the TRX and 3,5mm Soundcard output.
The picture on the mikolor site shows my cable that i used with my test with two uv5r

In both setups the TRX will not transmit on VOX, from the soundard nothing happens, from the UV5R to UV5R the TRX goes immediately on TX when the cable is pluged in.

Any ideas ?

So I just discovered a little something that may or may not be useful to everyone.

If you have a Baofeng with one of the latest firmwares in it (easy check, press and hold the "0" key and it will give you the battery voltage), then you may or may not have noticed that the cloning feature is gone. It's definitely gone in all the 8watt models, but you may still get it in the BF-F8+ series. Basically, if you hold the "EXIT" key then turn the radio on, it will say "Copying" and you can clone to another radio (See Miklor.com on Cloning radios for detailed explination).

Well, I have a "few" baofengs, and really love experimenting with them, basically I play a lot, but I like to have all my radios programmed with the exact same channels. So if I hit channel number 1 on radio A, it should be the same channel on Radio B, C, D, E,.... well you get the picture. And yes I think I have an addiction.

ANYWAY, it was really easy for me early on to just use my cloning cable, program one radio, then clone it to the other radios. I was kinda disappointed when that feature disappeared on my BF-F8HP.

Guess what. If I program my UV-5R, it will write the channels to ALL my other Baofengs! I've used it to sync channels to the BF-F8HP, BF-F8+, UV-5RTP, and even the UV-5X (so it should work on the the GT-3)!!

On the Tri-Power models, High is High, and Low is Low. When I import from CHIRP, High power from another radio goes to Med power on the tri-power models.

OK... so it may be a totally useless tool for a lot of people, but I thought it was a really neat thing.

73
James
W8JVF

49693. Re: [baofeng_uv5r] Cloning of UV-5R's / BF-F8HP's

Topic: 49692 Message: 49693

> On the Tri-Power models, High is High, and Low is Low. When I import from
> CHIRP, High power from another radio goes to Med power on the tri-power
> models.

This is by design. When you import an image from another radio, CHIRP tries to match the power level of the radio image being imported to the closest power level of the radio it is being imported to.

UV-5R -> BF-F9HP
HIGH/4 watts -> MID/4 watts
LOW/1 watt -> LOW/1 watt

BF-F8HP -> UV-5R
HIGH/8 watts -> HIGH/4 watts
MID/4 watts -> HIGH/4 watts
LOW/1 watt -> LOW/1 watt

So if you want all of your radios automatically set to HIGH power, then make one of the radios with 3 power levels the "master" and import it to the others.

This is a common problem. The chip in your programming cable is an unauthorized copy of the Prolific USB-to-TTL chip. The automatically installed Windows driver is designed to be not compatible with this chip. What you have to do is downgrade to a driver prior to when Prolific started making them incompatible. The most recommend driver for Windows Vista, 7, 8 and 10 is v3.2.0.0. You can get the driver and instructions to select it on the Miklor.com website.

There's a socket at the top of the 3800mah extended batteries for the UV-5R.

Can someone point me to a source for a cigarette lighter cable that will work safely.

I want to charge the extended battery off of the radio without carrying a charger base with me. According to the Miklor site:

6.7 Charging a 3800mAh battery using the side jack
To charge the BL-5L 3800mAh battery you must purchase a:
- TYT TH-UVF9 battery charger for 110VAC or
- TYT TH-UVF9D for 12VDC.

- These are fully regulated chargers
- Plugs directly into side of battery, not a charger base

A search on "TYT TH-UVF9D car charging cable" doesn't find anything useful.

All the cables that I've found in my search are unregulated. Some reviewers of them think there's a voltage regulator in the battery. True or not?

Mike

That is a bogus straight through charging cable. I have a few of them. However, the battery price is not too bad.

To use that cable I modified a 13.8-12 vdc car accessory socket to provide a 10vdc output (for uv5R vase) and another socket at 7.4-7.5 then that cable can be plugged in but since it does not have a sense in it for LI ION batteries it should be monitored.

I know there are some chargers that are bogus but you'd like to think if it comes with the battery it should work correctly. I'd measure the voltage on the pins though to be sure.

I think I'll order one just to test it.

Subject: [baofeng_uv5r] Source for TYT TH-UVF9D for 12VDC

There's a socket at the top of the 3800mah extended batteries for the UV-5R.

Can someone point me to a source for a cigarette lighter cable that will work safely.

I want to charge the extended battery off of the radio without carrying a charger base with me. According to the Miklor site:

6.7

Charging a 3800mAh battery using the side jack
To charge the BL-5L 3800mAh battery you must purchase a:
- TYT TH-UVF9 battery charger for 110VAC or
- TYT TH-UVF9D for 12VDC.

- These are fully regulated chargers
- Plugs directly into side of battery, not a charger base

A search on "TYT TH-UVF9D car charging cable" doesn't find anything useful.

All the cables that I've found in my search are unregulated. Some reviewers of them think there's a voltage regulator in the battery. True or not?

Don't you then have to do something to prevent Windows Update from updating it back up to the current driver?

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

This is a common problem. The chip in your programming cable is an unauthorized copy of the Prolific USB-to-TTL chip. The automatically installed Windows driver is designed to be not compatible with this chip. What you have to do is downgrade to a driver prior to when Prolific started making them incompatible. The most recommend driver for Windows Vista, 7, 8 and 10 is v3.2.0.0. You can get the driver and instructions to select it on the Miklor.com website.

I don't know, but I would be awfully suspicious of the "charging cable" shown in that eBay listing. There simply isn't physical room for the voltage and current regulation circuitry and some sort of heat sink in what they show in that listing. I would bet that their cable is straight through.

I have one of the actual TYT 12V chargers. (TH-UVF9D).
It’s sealed unit that would require actually cutting open (that’s not happening)
The side says 12.5 – 30.V Output: 8.4 @ 500Ma
The plug is wide enough to actually hold a small circuit board.

It works fine and there’s no doubt in my mind that is fully regulated.

I have a Win 7 64 bit platform with a genuine FTDI cable on Com 13 for UV5R/UV82 programming whihc works perfectly. I also have a counterfent UV3R (single pin) Prolific cable on Com 17 with Prolific Driver 3.4.67.325 and it caused the radio to force into TX when connected until the TOT time expires, then it works fine.

I have been reading how you can replace the driver with the 3.2.0.0 and have a happy world so I started the miklor procedure Cables & Drivers - Prolific & FTDI http://www.miklor.com/COM/UV_Drivers.php#install

http://www.miklor.com/COM/UV_Drivers.php#install

Cables & Drivers - Prolific & FTDI http://www.miklor.com/COM/UV_Drivers.php#install Cables & Drivers - Prolific & FTDI

View on www.miklor.com http://www.miklor.com/COM/UV_Drivers.php#install
Preview by Yahoo

I got to step 6 (I downloaded and executed Site 1 driver as it was an exe instead of a zip) and when I plugged in the counterfeit cable which used to be Com 17, it didn't appear. Com 13 FTDI was still there and working. I opened Chirp and it didn't recognize anything other than Com 13. I even rebooted the machine and although when I connected the cable to the usb port I heard the connect sound, it wasn't in ports . I checked Other Devices as instructed and there was a usb serial controller with no error indicator. I ended up having to revert/restore to remove the driver update so I could get the cable working again.

It went exactly like the instructions said up to right after step 6 the Other Devices-Com & Lpt where it was supposed to have a yellow bang symbol. It just had a normal usb serial controller in Other Devices and the previous FTDI in Com & Lpt ports.with no error symbol.

Any idea why it did not install with an error? If I look at Other Devices now after reverting out the driver 3.2.0.0 update (or downdate) there is no longer a usb serial driver in Other Devices so that must be what the driver software installed, just without an error.

> On the Tri-Power models, High is High, and Low is Low. When I import from

> CHIRP, High power from another radio goes to Med power on the tri-power

> models.

This is by design. When you import an image from another radio, CHIRP

tries to match the power level of the radio image being imported to

the closest power level of the radio it is being imported to.

UV-5R -> BF-F9HP

HIGH/4 watts -> MID/4 watts

LOW/1 watt -> LOW/1 watt

BF-F8HP -> UV-5R

HIGH/8 watts -> HIGH/4 watts

MID/4 watts -> HIGH/4 watts

LOW/1 watt -> LOW/1 watt

So if you want all of your radios automatically set to HIGH power,

then make one of the radios with 3 power levels the "master" and

import it to the others.

Topic: 49207 Message: 49721

hello there,

again thank you for your help, the relay is already programmed in my baofeng.
but it is not possible with chirp, the offset programming don't work..
i follow your advice and program entry and exit frequency of the relay with the other baofeng serie software.
thank you guys ! 73

No sacrifice for the greater good, eh? ;-)

OK, I've got an IC-T90a that has a CP-19 @ 2.5A output, and a TH-D72 with a PG-3J @ 2.0A, and both "cigarette lighter plug" adapters power their respective HTs for full TX operation at the same time they charge the batteries.

Just so I have this correctly, at just 0.5A, the TH-UVF9D will charge the BL-5L, but not power it for full TX, right?

I did notice 6.1 in the FAQ where it warns of operating the transceiver while charging, but the "in the charger" statement isn't that clear on mobile adapter usage. If the "good" 13.8VDC automotive plug chargers can lead to the same battery longevity issues mentioned in 6.1, then "on a charger" or "charging" might be a better way to say it.

Apr 20 12:40 PM, John LaMartina wrote:
I have one of the actual TYT 12V chargers. (TH-UVF9D).
It's sealed unit that would require actually cutting open (that's not happening)
The side says 12.5 – 30.V Output: 8.4 @ 500Ma
The plug is wide enough to actually hold a small circuit board.

It works fine and there's no doubt in my mind that is fully regulated.

There is more to it than finding a power supply that will knock 12-14 volts down to 8.4 volts. It also has to have the charging smarts to shut off once the charging is complete. This is what is extremely rare and the only device that I have been able to find that does this is the one that come with the TYT TH-UVF9 radio.

The reason it is not recommended that the radio be on while charging is because the extra current draw makes it hard for the circuitry inside the charger to determine when the Li-Ion battery is fully charged. Don't expect the charger that comes with a sub-$50 radio to as sophisticated as the charger built into a smart phone costing many times more.

Thank you...that is EXACTLY what was coming up. Like I said...I accidentally uploaded the base firmware on both radios...WITHOUT saving my original frequency IMG file...so I have NO frequencies to program...I got my original IMG file from a friend...uploaded off his PC...and of course...he doesn't have it anymore... So I kinda screwed without all the info. Radio reference only gives me the frequencies... Not all the other info needed....tones, duplex, +/-, offset, etc...I cannot find this info anywhere.
For instance....
"Twin City Ambulance "... Erie county...new York... This is where I work...I can only find the " frequency" not the other input variables.

All the information you need is publicly available. If you don't understand enough about the settings to be able to put the information in the right column of Chirp, people will be happy to try to educate you about Chirp.

You might start by telling us your callsign and some description of what you are trying to accomplish.

Frequency and CTCSS Tone or DCS Code information for open amateur repeaters is almost always easily found online. If a particular repeater isn't listed obviously online, you can certainly get the information from another local ham.

If you are looking for information for some commercial frequencies, you would get that information from the people managing the system -- you have to have the license holder's permission before you can transmit (and you have no need whatsoever for CTCSS Tone or DCS Code information if you are only listening).

If you are looking for information about Public Safety frequencies (Fire, Police, EMS, etc.) the frequency information is almost always readily available online and you certainly have no need whatsoever for any CTCSS Tone or DCS Code information.

So, just tell us who you are and what you are trying to accomplish and I'm sure someone will be able to help you learn how to properly program your radio.

From: cooneye2002@...
Topic: 49733 Message: 49733

A friend programmed my UV5RTP using Chirp. He had a little trouble at first, but he was able to
complete the programming. After getting home, I was doing a little testing and I noticed that I

could not manually change any settings. All my channels are set to medium power. I can change

it to high power and is confirmed but when I go back, it reads medium.
Anyone know what's going on?
Thanks in advance.

Granted, the transceiver shouldn’t be operated with a charger connected. But back to the original question, seems the OP was looking for a source for the cable in his subject line, and it’s just not out there.

What does seem readily available is the Baofeng CH-5 charger base that comes with the transceiver, and extra CH-5s can be bought for $10 (R&L) and less (eBay/China). It has the sense circuitry necessary and LED status indication. The CH-5 can be easily opened, and the PCB in there isn’t that big. It only has two wires (10VDC+ and ground) in and two wires (8.4V+ and ground) out. Seems to me a person with reasonable skill could take that PCB, put it in a small project box with a LM7810 & heatsink or a buck convertor, put that inline with one of the bogus Vin=Vout BL-5L cables and have what they’re looking for… a charger for their BL-5L they can use in a vehicle without having to worry about the battery flying out of the charging stand at every turn.

Unless someone comes up with a URL for the illusive TYT cable, or has a valid argument that will shoot this idea down, that’s what I’d be doing.

Here is a TYT F9D special Tri-band version with scrambler/ and 7W power up package

Notice it has a modified Baofeng 3800 ma battery the TYT charger is connected to the side socket which allows me to charge via side socket or bottom contact base method.

Those wanting a radio that is a step up from the UV5R series but very close in layout and function you might want to look into the TYT versions.

Anyway this IS the CHARGER unit that you want to use, it charges the stock TYT batteries and the modified fitted Uv5R hi-caps.

Craig C is a TYT authorized dealer in this group so you might want to order from him for the charger units to insure you will get something that works.

Hope the pictures are clear if not I will send a model/pn close up of the charger label off group

Not being there it is hard to say. My guess is that your are missing a step or overlooking something.

With the programming cable unplugged, I would go into Control Panel "Uninstall a program" and uninstall anything Prolific (look for "PL-2303").

Reboot for good measure

Still with the programming cable unplugged, install the v3.2.0.0 driver from the miklor.com website

Now plug in the programming cable. This should cause Windows download and install the latest Prolific device driver. If all goes as planned, it should fail. At this point would should be able to start as step 6 and choose the v3.2.0.0 driver and all should be good.

You may get something out of watching this video: https://youtu.be/arpGoThEtCE

You cannot modify the per-channel settings (like power, bandwidth, etc.) of an existing memory from the keypad.

Like Jardy mentioned, you can erase the channels that you want set to high power, and program them back at the higher power level using the keypad.

Another solution would be to take the radio back to your friend and have him change the power level to high.

A third solution would be what I do. I program all of my Baofeng radio channels to the LOWest power level. Then I temporarily toggle to MID or HIGH power using the [#] key only when I need "more power". That way I get better battery life and comply with the FCC requirement to use only the power necessary to maintain communication.

What is going on is that the radio is working exactly the way it is supposed
to. Perhaps you might consider reading the information on the Miklor.com
website that explains how your radio works.

This email has been checked for viruses by Avast antivirus software.

The TYT UVF9D is readily available with its cable, but it does seem that no one is selling the cable alone.

Which might be just as well considering that "the transceiver shouldn't be operated with a charger connected."

> at every turn.

Except that the BaoFeng charger won't work at 14v or even 13.8 or whatever a typical automotive electrical system provides while the engine is running. In fact, although the BaoFeng chargers do vary quite a bit, most of the BaoFeng chargers will overheat badly with even a 12v input due to the lack of any heatsink to handle the waste heat produced by the voltage regulator.

So yes, you could build a set of Rube Goldberg contraptions to first reduce the supply voltage to around 10v, then pass that 10v to the cannibalized BaoFeng charger wired to a plug to go into the socket on the side of the battery -- all of which takes us back to THE TRANSCEIVER SHOULDN'T BE OPERATED WITH A CHARGER CONNECTED - not because it will hurt the transceiver but because it WILL hurt both the charger and the battery.

> Unless someone comes up with a URL for the illusive TYT cable,
> or has a valid argument that will shoot this idea down, that’s
> what I’d be doing.

If you really want to rip a charger apart just to get the circuit board to use in a project that cannot work, at least start with the right charger. Instead of a BaoFeng CH-5 use a TYT BCG-F8 available from 409 Shop for $12.50 including shipping to the US
http://www.409shop.com/409shop_product.php?id=106604
The TYT charger is assembled more carefully than the BaoFeng and uses better components - it will work properly with a running automotive electrical system.

But the far better choice is to simply buy the TYT Charger base but not cannibalize it at all - just use it to charge the battery (either in the car or at home). All of this discussion has been about using something to feed power to the 3800 mAH battery -- but guess what? The battery doesn't need power fed to it. Even on one of the supposed 8W radios, that battery will still last much longer than any reasonable person is going to drive and talk continuously. Even for a long winded professional, driving as part of a two-driver team, the most effective solution to continuous usage would be to have a second 3800 mAH battery and a TYT charger in the truck - just power the radio from one battery while the other battery is in the charger. And if they really drive badly enough to have the battery likely to bounce out of the charger base, just put a rubber band around it to hold it in place - Problem Solved!

Please clarify your reasons why the PCB from the CH-5, when fed with the properly regulated input voltage, “cannot work” to charge the BL-5L battery via the coaxial jack on its side.

I can’t fathom repackaging that being more “Rube Goldberg” than your advice to use another manufacturer’s charging stand and a rubber band. Let’s remember the OP’s statement:

“I want to charge the extended battery off of the radio without carrying a charger base with me.”

You need to hook the radio up to the computer again. Read the file from the radio and in each entry left click on the channel in the list and select edit. Up pops the box with all the channel information. Scroll to near the bottom of the box and in the power section simply change it to high. You could get your friend to do this in advance with the file used to program your radio so you can just hook up and upload. The file used may have been written for a UV-5R with only two power settings - the 5RTP obviously has three power levels so the program wouldn't recognise your 8W settings.

Sent from my LG G3, an AT&T 4G LTE smartphone

------ Original message------From: w4iwk@arrl.net [baofeng_uv5r] Date: Mon, Apr 20, 2015 9:18 AMTo: baofeng_uv5r@yahoogroups.com;Subject:[baofeng_uv5r] Source for TYT TH-UVF9D for 12VDC

There's a socket at the top of the 3800mah extended batteries for the UV-5R.
Can someone point me to a source for a cigarette lighter cable that will work safely.
I want to charge the extended battery off of the radio without carrying a charger base with me. According to the Miklor site:6.7 Charging a 3800mAh battery using the side jack
To charge the BL-5L 3800mAh battery you must purchase a:
- TYT TH-UVF9 battery charger for 110VAC or
- TYT TH-UVF9D for 12VDC.

- These are fully regulated chargers
- Plugs directly into side of battery, not a charger base

A search on "TYT TH-UVF9D car charging cable" doesn't find anything useful.
All the cables that I've found in my search are unregulated. Some reviewers of them think there's a voltage regulator in the battery. True or not?

Just got a Baofeng BF-F9HP 8 watt HT off of amazon. It will only go between 430 and 440.995 MHZ on the 70cm band. No good for the US repeater subband. I did a full reset like was suggested in some of the reviews, and that didn't help. Don't have the programming cable and software and have no intention of buying it. Can someone help me get this to work on 444mhz? Every other Baofeng I have had transmits over a 80mhz range on 70cm.

I've found several tri power models that do this. They don't do the full advertised range on the 2m side either, although they will do the full legal 2 meter range. Baofeng is aware of the problem, as is Radioddity.

As well many of them should because there is nothing at all wrong with many of the returns, unfortunately there are also many returns that really did have problems that also get put back into the queue. The problem is that "testing" something like these radios is rarely effective unless the radio is totally DOA. A no-questions-asked returns policy produces a ton of returns with nothing wrong with them beyond an incompetent buyer - but it also means that no one knows why a specific item was returned so no one can be sure that there isn't some problem in what seems to be a working radio.

Since you refuse to get the cable, you can either find someone who has a cable or you can send the radio back to whatever country it came from and buy one from a dealer in the US or China.

I would like to think I am not incompetent. I would just like a HT that works on the repeater subband. Guess it will have to become a SO50 radio since it does receive in the satellite portion of the band. Really didn't buy it for that. It seems that every generation of radio that Baofeng puts out gets worse than the previous generation. The UV-82 has problems with the FM broadcast band receive that the UV-5R doesn't. Now this problem with a "updated" model of the UV-5R. So much for progress.

49758. Baofengradio.us has some shady business going on

Yahoo group: baofeng_uv5r (2015)
Date: 2015-04-23 23:02:31 UTC
From: t_verizon@...
Topic: 49758 Message: 49758

I shared earlier on radioreference after I had a bad experience with baofengradio.us supposed warranty support and thought it would be good to share here too:

First right off the bat - BaofengRadio.us has a location in Houston, TX but there is an interesting back trail on where there money is coming from and what it is funding.

Baofengradio.us is owned and operated by Foscam.us. When I could never get any responses or warranty help on a BF-F9v2+ from emails I sent on their website (both of them); it was time to get investigating! In what I find below I will not go into what 'other businesses' have claimed as they have an obvious conflict of interest.

First came their BBB Page - it appears the only way to resolve things with them is to file a complaint - in which they will finally resolve refunds and repairs that they advertise (41 complaints is no small number) : ---http://www.bbb.org/houston/business-reviews/computers-supplies-and-parts/foscam-digital-technologies-llc-in-houston-tx-90018826/ http://www.bbb.org/houston/business-reviews/computers-supplies-and-parts/foscam-digital-technologies-llc-in-houston-tx-90018826/ --- in comparison other radio companies have around 3 or less. Including large brick and motor stores like Ham Radio Outlet - to online Shops like Radio-mart.net

These are complaints that take someone time to file with the BBB against Foscam.us most with the same story of unanswered help or support.

Next came the Management search on LinkedIn - which was easy to find the Managing Director (basic term for Owner in LLC Corps): https://www.linkedin.com/pub/abdurah...avat/2a/6b/986 https://www.linkedin.com/pub/abdurahman-adam-ravat/2a/6b/986 - Mr Abdurahman Ravat

Googling the Information from "Abdurahman (Adam) Ravat and Foscam" it appears the other partner is "Yusuf Ravat"

Some more Googling and Abdurahman (Adam) Ravat has quite the portfolio associated with him Ravat Trading LLC in Houston TX - Company Profile http://www.corporationwiki.com/Texas/Houston/ravat-trading-llc/68621400.aspx - including many pointless family 'shell corporations' and a freight company.

Next to the Facebook research, pulling up their main company webpage you can search for employees of Foscam: https://www.facebook.com/search/3341...5437/employees https://www.facebook.com/search/334157603335437/employees - and wouldn't you know this US company has an all-star line-up; and not so many 'smiths' or 'jones"'on their roster either to be blunt.

So now to find "Abdurahman" or "Yusuf" from here - which is easy, click on an employee search of their friends and up pops "Yusuf Ravat" - so the dots of who is behind baofengradio.us is all coming together.

Now I do not intend to be disrespectful to anyone or nationality - but for my own patriotic sake it disturbs the fire out of me the employees connected to Pakistan and Pakistani

ideologies - are masquerading ".us" websites. Now I understand that most of the money is going to China, but to see that what little profit funds are now linking to the Middle east gives me a bit of chill; and the multitude of empty shell corporations with no legitimate reason linked to the owners gives the mind some fantasy on what the profits from radio sales and cameras are going to.

Viewers that enjoy "American Greed" will most likely see this "hero" soon on the next episode with all the signs of money laundering and red flags going on!

Now I will not say with definite promise this is a 'scam' as found on the web - but I am not risking my money to fund questionable businesses or business practices. There are many other sellers I can buy from without very shady backlogs.

I believe my lack of "warranty support" and the high level of BBB complaints - were enough to avoid these guys. But adding to the waters the murky shell companies and you are getting close to shady territories that I am uncomfortable dealing with.

You can take the information as you want to but I am not supporting this company or it's eBay http://www.ebay.com/, Amazon, and other aliases.

Most are switching models away from the Generic Baofeng $30 radios. A lot of new models out that seem to be a few steps up. Some come in the same case style as the uv5 so accessories fit.

Unless someone wants a specific uv5R with a Part 90 sticker on them for some S/R work, I will not sell the uv5R’s. However, I do sell the 220 uv82’s, and the F8 clones HP’s.

This means most of the uv5R’s are being dropped by brick and mortar based US dealers and carried mostly by online sellers making it hard to keep track if you’re getting the latest model or a problematic version with little recourse to return the radio.

I saw an Icom and Kenwood marked Uv5R version radio, hilarious what some will do to sell these radios.

As a matter of fact I am tempted to buy a few Icom and Kenwood boxed uv5R cased radios for a gift gag.

Subject: Re: [baofeng_uv5r] Help with Baofeng BF-F9+HP

I would like to think I am not incompetent. I would just like a HT that works on the repeater subband. Guess it will have to become a SO50 radio since it does receive in the satellite portion of the band. Really didn't buy it for that. It seems that every generation of radio that Baofeng puts out gets worse than the previous generation. The UV-82 has problems with the FM broadcast band receive that the UV-5R doesn't. Now this problem with a "updated" model of the UV-5R. So much for progress.

As well many of them should because there is nothing at all wrong with many of the returns, unfortunately there are also many returns that really did have problems that also get put back into the queue. The problem is that "testing" something like these radios is rarely effective unless the radio is totally DOA. A no-questions-asked returns policy produces a ton of returns with nothing wrong with them beyond an incompetent buyer - but it also means that no one knows why a specific item was returned so no one can be sure that there isn't some problem in what seems to be a working radio.

John,

Many of the Chinese sellers ship a volume order to Amazon in the U.S., and they (Amazon) will then re-ship your order via 2-day shipping (if you are an Amazon Prime member), so you may still be dealing with a Chinese supplier.

Xuan,

One of our corporate customers purchased (50) UV-5R radios from Amazon a few weeks ago and dropped them over here (unopened) for programming on their assigned FCC VHF frequency (on a "when you have some spare time could you test/program these for me please?") kind of thing.

Slightly more than half of the radios don't have the required FCC Part 90 certification (27 so far) and many of them with the FCC Part 90 sticker have various defects, including bad display screens, no audio (at all) on transmit even though the CTCSS tones work on transmit, bad power supplies, etc., - so unlike some folks, we actually know what an HP 8920A is and can see what the radio is actually doing (or not doing) when it's on the testing bench.

Every single one that we find that's bad (so far) has been sent back by the customer to Amazon (no questions asked) and I'd be willing to bet will be placed back into stock for re-shipment on the next customer order. That high failure rate right out of the box (combined with the non-FCC Part 90 certification) may not seem like a problem to you, but I'd say that's a fairly high number of various problems (some more serious than others I admit), but then again maybe they just got a "bad batch"?

This might be what I was told from Chinese wholesalers about various dealers operating here in the USA (EB-5 visa) you can look up those post of mine. The problem is they told me it was BaofengTech, I think that was an error. It looks like it is more directed towards the group you mentioned below.

Also most likely they were referring to the group you mentioned along with the fact it is also operated by Chinese too- as a joint venture.

No matter who operates it, if the service is not good and having the USA flag waved under a EB-5 biz setup is not good as it is full of fraud.

DHS is in charge of this nightmare program and around in my area it is used as visa scams for getting Green Cards with no oversight-.

Subject: [baofeng_uv5r] Baofengradio.us has some shady business going on

I shared earlier on radioreference after I had a bad experience with baofengradio.us supposed warranty support and thought it would be good to share here too:

First right off the bat - BaofengRadio.us has a location in Houston, TX but there is an interesting back trail on where there money is coming from and what it is funding.

Baofengradio.us is owned and operated by Foscam.us. When I could never get any responses or warranty help on a BF-F9v2+ from emails I sent on their website (both of them); it was time to get investigating! In what I find below I will not go into what 'other businesses' have claimed as they have an obvious conflict of interest.

First came their BBB Page - it appears the only way to resolve things with them is to file a complaint - in which they will finally resolve refunds and repairs that they advertise (41 complaints is no small number) : ---http://www.bbb.org/houston/business-reviews/computers-supplies-and-parts/foscam-digital-technologies-llc-in-houston-tx-90018826/ --- in comparison other radio companies have around 3 or less. Including large brick and motor stores like Ham Radio Outl et - to online Shops like Radio-mart.net

These are complaints that take someone time to file with the BBB against Foscam.us most with the same story of unanswered help or support.

Next came the Management search on LinkedIn - which was easy to find the Managing Director (basic term for Owner in LLC Corps): https://www.linkedin.com/pub/abdurah...avat/2a/6b/986 - Mr Abdurahman Ravat

Googling the Information from "Abdurahman (Adam) Ravat and Foscam" it appears the other partner is "Yusuf Ravat"

Some more Googling and Abdurahman (Adam) Ravat has quite the portfolio associated with him Ravat Trading LLC in Houston TX - Company Profile - including many pointless family 'shell corporations' and a freight company.

Next to the Facebook research, pulling up their main company webpage you can search for employees of Foscam: https://www.facebook.com/search/3341...5437/employees - and wouldn't you know this US company has an all-star line-up; and not so many 'smiths' or 'jones"'on their roster either to be blunt.

So now to find "Abdurahman" or "Yusuf" from here - which is easy, click on an employee search of their friends and up pops "Yusuf Ravat" - so the dots of who is behind baofengradio.us is all coming together.

Now I do not intend to be disrespectful to anyone or nationality - but for my own patriotic sake it disturbs the fire out of me the employees connected to Pakistan and Pakistani ideologies - are masquerading ".us" websites. Now I understand that most of the money is going to China, but to see that what little profit funds are now linking to the Middle east gives me a bit of chill; and the multitude of empty shell corporations with no legitimate reason linked to the owners gives the mind some fantasy on what the profits from radio sales and cameras are going to.

Viewers that enjoy "American Greed" will most likely see this "hero" soon on the next episode with all the signs of money laundering and red flags going on!

Now I will not say with definite promise this is a 'scam' as found on the web - but I am not risking my money to fund questionable businesses or business practices. There are many other sellers I can buy from without very shady backlogs.

I believe my lack of "warranty support" and the high level of BBB complaints - were enough to avoid these guys. But adding to the waters the murky shell companies and you are getting close to shady territories that I am uncomfortable dealing with.

You can take the information as you want to but I am not supporting this company or it's eBay, Amazon, and other aliases.

I got sick of this too and stopped dealing with them if all possible.

I used the HP 8902 to do my radio RF stuff in the Nav.

They are nice but most likely outdated now. Maybe the 8920 replaced it?

Could you imagine if that was 50 mobiles? And you had to eat the shipping costs sending them back? That is why I do not carry the new Baofeng mobiles until they are fully tested on the market.

I bet the guy stuck going through all the boxes is enjoying himself finding many are defective :*

I tried the Amazon Prime and it's OK if the item you want is in China.
But even if the item you want is in the USA there is still a 1 to 2 day processing wait before it goes out.
I'm waiting for their drone deliveries but I think that was a total flop.
I have to look into the F9-HP models

Regarding the 50 radio order for UV-5R. The cost of processing these, and returning the defective ones, would seem to me to be more than sufficient justification to spend more and get 50 radios that you know will work properly out of the box, with proper FCC stickers/certification. For roughly $110 per radio, you can buy decent quality Part 90 compliant equipment, and I'm sure you can beat that price substantially with an order for quantity 50. Why screw with Baofeng when you can bypass all the hassle and grief?

For the individual who is looking for the cheapest option out there, Baofeng may well be a good solution. For a business, I would never recommend them. There is more to the bottom line than the lowest cost to purchase.

Bad business is bad business, no matter the nationality, but at least he was able to find ownership and staff information on Baofeng.us without too much effort.

BaofengTech has only released or posted information about their operation when forced (and even then, very slowly). For months, their only address was a PO Box, now they list their physical address (which just happens to be the physical location of the local Post Office in the tiny town they may (or may not) really exist in. No actual ownership information is given, their website data is marked as private, and no one is their local Chamber of Commerce has even heard of them (in a tiny town of around 400 people, which would be difficult to believe).

In addition, no one at the their state tax bureau has any record of them being in existence either, so my hunch would be they really aren't physically in the U.S. (at least as a real company, although they may have a single employee or two here to appear as a U.S. company if someone calls or a repaired unit or part needs reshipped) and merely drop-ship the vast bulk of their items to Amazon when needed.

Since both of these outfits operate through Amazon, it's relatively easy to get the item(s) you need, and if a return is warranted, Amazon makes it

easy (IMHO - too easy).

As an interesting side note, I was at the IWCE show last month in Las Vegas, and none of the 3 Baofeng folks at their booth had ever seen either the BF-F8HP or the BF-F9V2+ units (I had both with me at the time), which means that the left hand (at Baofeng) doesn't even know what the right hand (at Baofeng) is doing, so I guess that's not just a trait of American companies.

For under $100 and Part 90 approved, you may want to consider one of the two Anytones.
NSTIG-8R http://amzn.to/1EMAl2n
OBLTR-8R http://amzn.to/1EMA8wn
There are others out there as well. I agree, cheapest is not always the wisest way to go.

Regarding the 50 radio order for UV-5R. The cost of processing these, and returning the defective ones, would seem to me to be more than sufficient justification to spend more and get 50 radios that you know will work properly out of the box, with proper FCC stickers/certification. For roughly $110 per radio, you can buy decent quality Part 90 compliant equipment, and I'm sure you can beat that price substantially with an order for quantity 50. Why screw with Baofeng when you can bypass all the hassle and grief?

For the individual who is looking for the cheapest option out there, Baofeng may well be a good solution. For a business, I would never recommend them. There is more to the bottom line than the lowest cost to purchase.

Just so we're clear, we didn't sell the corporate customer the (50) UV-5R's, his purchasing department bought them to fulfill his internal request. We were merely testing/programming what they brought us (for a fee per radio). I'm also not suggesting that every order would be defective either, but since Amazon doesn't seem to send any radios back to their source you have to wonder where all of the returns are going.

I've even seen radios with notes inside the sealed box written in English (detailing what the previous Amazon customer found wrong with it), yet the radio was reshipped back out on another new order (fortunately the customer was here when he opened his UPS box and handed me the radio, or I'm sure our programming would have been accused of breaking his new radio).

I'm beginning to wonder if Baofeng shut down their factory for six months if Amazon's UV-5R shipments would drop off, or would the incoming returns to them just keep getting recycled over and over to new Amazon customer orders.

I already filed a defective merchandise claim with Amazon, printed off the return shipping label, dropped the package off at Staples, and it is on its way back for a refund. This is the second HT I have bought off of Amazon, and neither worked correctly. The first one didn't receive or transmit. It was a used radio, though. Fortunately, you are never out any money as you don't have to pay any return shipping.

Wish I could find a Baofeng that received the broadcast band FM a little better than the UV-5R does. It does ok, but there are spots in my neighborhood where the station I listen to gets scratchy and another station breaks in. I don't remember this happening with the UV-3R I had but I could be wrong. Might have to go back to one of those.

Which Baofeng models have the best broadcast band FM receiver on them? It certainly isn't the UV-82.

I hate to tell everyone this but directly from China they are bad too. While Amazon might be recycling returns or known bad ones are dumped there to get rid of them from Asia, I have had a few bad BF F8’s come in too. This is recently. In addition are the uv5R’s coming in the smaller boxes (GT3 size, with Pofung marked on the box? This is the new factory release version.

This is why I switched to the Zastone uv5R clones. However the same crappy parts suppliers also make the parts for the Zastone’s too. At least Zastone seems to test them first.

I dread the prospects of all the potential bad ones coming in that I ordered just for Part 90 people (has stickers) next week.

Any Firmware or OTP date stamps on the bad ones? So we can avoid if they had a bad batch release again?

Subject: Re: [baofeng_uv5r] Help with Baofeng BF-F9+HP

Well that explains the three in a row UV5R types I got from Amazon a couple months ago that all had defects. I gave up and am saving for a name brand.

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

John,

Many of the Chinese sellers ship a volume order to Amazon in the U.S., and they (Amazon) will then re-ship your order via 2-day shipping (if you are an Amazon Prime member), so you may still be dealing with a Chinese supplier.

Xuan,

One of our corporate customers purchased (50) UV-5R radios from Amazon a few weeks ago and dropped them over here (unopened) for programming on their assigned FCC VHF frequency (on a "when you have some spare time could you test/program these for me please?") kind of thing.

Slightly more than half of the radios don't have the required FCC Part 90 cert ification (27 so far) and many of them with the FCC Part 90 sticker have various defects, including bad display screens, no audio (at all) on transmit even though the CTCSS tones work on transmit, bad power supplies, etc., - so unlike some folks, we actually know what an HP 8920A is and can see what the radio is actually doing (or not doing) when it's on the testing bench.

Every single one that we find that's bad (so far) has been sent back by the customer to Amazon (no questions asked) and I'd be willing to bet will be placed back into stock for re-shipment on the next customer order. That high failure rate right out of the box (combined with the non-FCC Part 90 certification) may not seem like a problem to you, but

I'd say that's a fairly high number of various problems (some more serious than others I admit), but then again maybe they just got a "bad batch"?

Just got a Baofeng BF-F9HP 8 watt HT off of amazon. It will only go between 430 and 440.995 MHZ on the 70cm band. No good for the US repeater subband. I did a full reset like was suggested in some of the reviews, and that didn't help. Don't have the programming cable and software and have no intention of buying it. Can someone help me get this to work on 444mhz? Every other Baofeng I have had transmits over a 80mhz range on 70cm.

I think 3rd parties are buying the components (possibly QC reject stuff) and/or relabeling them with various other models to cash in on the Baofeng name.

You want to get a really good chuckle... check these out. I was asked by their reps in China if I wanted a Kenwood or Icom.

Here is the video what a good laugh. All Uv5R users and Kenwood fans need to watch this .

I wasn't suggesting that YOU are incompetent - but I can assure you that MANY of these radios are returned because the buyer simply can't figure out how to program or operate the radio or finds that they bought a radio that can't do what they want (such as talk on 27MHz CB). I'd guess that around half the BaoFeng radio returns on Amazon are radios with NOTHING wrong with the radio. The problem the other poster mentioned, about Amazon returns being resold, is actually true of many distribution channels - when an item is returned, it is checked and if nothing is found wrong it gets sold (hopefully as used or refurb, but in some cases it gets resold as new). This doesn't just happen online, it happens in real stores as well. Generally speaking, the easier the return policy, the more likely that the seller will be taking back perfectly good items which they will then repack and resell.

Subject: Re: [baofeng_uv5r] Help with Baofeng BF-F9+HP

I would like to think I am not incompetent. I would just like a HT that works on the repeater subband. Guess it will have to become a SO50 radio since it does receive in the satellite portion of the band. Really didn't buy it for that. It seems that every generation of radio that Baofeng puts out gets worse than the previous generation. The UV-82 has problems with the FM broadcast band receive that the UV-5R doesn't. Now this problem with a "updated" model of the UV-5R. So much for progress.

Probably one of my favorites, and one of my favorite companies to sell CCJ.

The A-V85 has pretty good gain also, and is stable as heck, and yes. I've thrown in around in and out of the pack, door well of the car, on my hip daily, and even my 19 month old has drug the radio around by this very antenna, and it still works. It's not as "sleek" or "sexy" as some of the others, but it takes a licking.

So yeah... I recommend it.

For those looking for Part 90 certified radios, you may also want to take a

look at some of the TYT and Wouxun models as well (some are under $100 and

a couple are just over $100, but all of them are much less coin than the
Japanese rigs).

Rich,

That's a good one, but at least the voice announcements sound better than China girl. Did you notice how the same battery is now supposed to be 3000 mAh? I wonder how long it will be before BaofengTech announces a 3200 mAh battery to one up them?

I'd be inclined to put some "failed" stickers on them, both on the radio
and the box, before you send them back. If they get sent out again
without being checked, the next customer will have something to complain
about.

Obviously, they are not a member of the BBB either. Members usually don't have complaints against them listed. For those that don't know, the Better Business Bureau is NOT a government agency, it's a private company that is supported by selling memberships. They have no real power. It has been shown that members may not have complaints listed against them while nonmembers do. They have as much power as Angie's List. That's why I do business with legitimate dealers (like KJI Electronics in NJ). Might be a bit more expensive but it's worth it. BTW, I have no connection with KJI Electronics, just a satisfied customer and I've had "issues" with companies and the BBB was no help at all.

There is a simple answer. Don't expect cheap Chinese radios to be anything other than just what they are. You pays you money, you takes your chance. No offence intended, but Baofengs cannot be viewed as serious equipment. They barely meet some requirements and as a budget HT or for a novice to cut his teeth on they're ok - just don't expect it to be as good as (for example) a Yawsu/Kenwood/Icom radio.

Subject:Re: [baofeng_uv5r] Help with Baofeng BF-F9+HP

I already filed a defective merchandise claim with Amazon, printed off the return shipping label, dropped the package off at Staples, and it is on its way back for a refund. This is the second HT I have bought off of Amazon, and neither worked correctly. The first one didn't receive or transmit. It was a used radio, though. Fortunately, you are never out any money as you don't have to pay any return shipping.

Wish I could find a Baofeng that received the broadcast band FM a little better than the UV-5R does. It does ok, but there are spots in my neighborhood where the station I listen to gets scratchy and another station breaks in. I don't remember this happening with the UV-3R I had but I could be wrong. Might have to go back to one of those.

Which Baofeng models have the best broadcast band FM receiver on them? It certainly isn't the UV-82.

Just so we're clear, we didn't sell the corporate customer the (50) UV-5R's, his purchasing department bought them to fulfill his internal request. We were merely testing/programming what they brought us (for a fee per radio). I'm also not suggesting that every order would be defective either, but since Amazon doesn't seem to send any radios back to their source you have to wonder where all of the returns are going.

I've even seen radios with notes inside the sealed box written in English (detailing what the previous Amazon customer found wrong with it), yet the radio was reshipped back out on another new order (fortunately the customer was here when he opened his UPS box and handed me the radio, or I'm sure our programming would have been accused of breaking his new radio).

I'm beginning to wonder if Baofeng shut down their factory for six months if Amazon's UV-5R shipments would drop off, or would the incoming returns to them just keep getting recycled over and over to new Amazon customer orders.

Regarding the 50 radio order for UV-5R. The cost of processing these, and returning the defective ones, would seem to me to be more than sufficient justification to spend more and get 50 radios that you know will work properly out of the box, with proper FCC stickers/certification. For roughly $110 per radio, you can buy decent quality Part 90 compliant equipment, and I'm sure you can beat that price substantially with an order for quantity 50. Why screw with Baofeng when you can bypass all the hassle and grief?

For the individual who is looking for the cheapest option out there, Baofeng may well be a good solution. For a business, I would never recommend them. There is more to the bottom line than the lowest cost to purchase.

Of course Sean is right, but like in the case of my corporate customer's purchasing department mistake, the ad they saw on Amazon said it was a commercial radio, said it was for the U.S. market, and it was supposed to have FCC certification and cover the frequency they needed, so they bought them for their business.

It was only when they brought them here for testing/programming that they saw the fallacy of looking solely at their product acquisition cost to make their decision. It surely will end up costing them far more in time, money, etc. than they "saved" by buying their radios through a third-party seller on Amazon.

Time will tell if they truly learned their lesson.

It depends on where in the world you are and what frequency you are programming.

For the Private Land Mobile Service in the USA, it must be narrow. For most Amateur Radio use in the USA, it would be wide.

For listening only, it doesn't matter. There is no change in the receiver between modes. There is only a slight boost in the audio level when NARRow is selected.

I have had this happen on several radios belonging to members of a 4wd club (licenced hams).In each case the same freq in the same channel position (Channel 0) just disappeared.By chance we have found that if you press V/M not only is the freq there but you may now be able to use the channel.This does not fix the problem but is a work around.

This is true for the UV-5R. FWIW, there are some Baofeng models that do
change RX BW when narrow mode is selected: the UV-B5/B6 does.

I may have figured out what is going on.
When I plug or unplug the programming cable it will work briefly then go
back to not txt on that freq.
Strange thing I can swap over to other channel and it works.
I'm thinking that it may be in the Mic plug either not opening or closing.
Will be working on it tomorrow I will also send you an image Jim tomorrow.

From: nzrees@...
Topic: 49793 Message: 49800

Yes, usually everything still ok. in VFO mode but the channel (in this case simplex) disappears when in Memory mode.

These radios have operated for about 1 year without any problems. No extra programming etc had been done to them and they were operated by different people.

After reprogramming with Chirp they have operated ok so far (couple of months). In future I am not going to programme the most commonly used channel into channel '0' position. and see if this avoids the problem.

what could keep a radio from transmitting on any and all of the channels it only transmits while in the VFO/freaq mode ?? thanks

You might have tx inhibited in mr mode. Check the FAQs and the Miklor web site.

Yeah, and the name "Kenwood" is the internal name for the plastic mold used

and has nothing to do with the actual Kenwood company (chuckle). Rich, I'd
hold off until they change the UV-5R label to say APRS instead. That way

it will be worth a lot more to your Kenwood friends.

Sadly, you are also correct. As the success of various Chinese radio vendors has shown (with Baofeng leading the way), customers will buy primarily on price and then spend hours trying to get their radio(s) to work the way the more expensive radios do, or try to hack into existence some missing feature or function.

In general, the Baofeng HTs do what I need an HT to do, not sure what a more expensive model by Kenwood or Yaesu would do, other than provide me with some unnecessary features, and many times they don't do as good as the Baofeng in terms of what I need an HT to do.

But if the receiver in the baofeng works just fine for you, it's hard to justify a radio that costs more than 4x as much. If I can hear the repeater clean, and they can hear me, that's all I need.

I agree with you 100% I have 3 of the UV 5R. E2+ and the 3+ and a very early model and I also worked the ISS with them. When I leave the area I just manually program them and I use a 5/8 wave dual band antenna. So far not a single problem Bob AF2Q

Not only a better receiver but better tx and build quality. In my opinion (and I own several Baofengs) they are great if you're on a budget and work ok, however if you can afford a radio from one of the more "high end" manufacturers then go for it. I have radios from Icom, Alinco and Yaesu and they out perform the Chinese stuff by a huge margin

I wasn't trying to start a debate, merely observing that Baofeng (and other

Chinese outfits) lead with price, not features.

I also own far more radios than the wife probably knows about (Alinco, Baofeng, Icom, Kenwood, Motorola, Powerwerx, Relm, Standard, TYT, Wouxun, and Yaesu), and while the Baofeng's have their fans, it would not be the radio I'd take to any hot RF environment (like a mountaintop summit with 20 or more high power commercial transmit sites along with several amateur repeater sites). The front end of the Baofeng simply would not hold up. But if the trip involves any climbing or water activities in the great outdoors, I wouldn't think twice about it, since I'd drop one in my waterproof HT bag and off we'd go.

I also normally have several Baofeng's (of different models) in each of our 4WD vehicles precisely because if they are lost, dropped, or run over I won't be mad as hell all the way back from our trip. With the bigger 3800 mAh battery and our TYT cigarette lighter/chargers, it's just too convenient to leave it home.

I am wondering if there is some website that has ready-made *.img files for CHIRP ready to download so all i need to do is upload it to the radio.

You should never directly upload a CHIRP Radio Image (*.img) file to a Baofeng radio that was not originally saved from that radio. If you get a CHIRP image that is "foreign" to your radio, and yes they are available, then you must load it into a separate tab and copy-and-paste the data from "foreign" tab to your radio's tab or use the CHIRP "Import" feature to import the channels.

You can also import channels from RepeaterBook and RadioReference by using the CHIRP "Query Data Source" feature.

You are right. Why pay for what you do not use. The main problem I have had with the Baofeng radios is very poor selectivity. They will open squelch on almost any moderately strong signal within a range adjacent to your programmed frequency. This means I get interference from my wifi devices and other frequencies near my desired one. Example: Connected to a J-Pole I have a repeater programmed to receive 147.210. I can hear a repeater from 60 miles away on 146.990. That is REALLY poor selectivity. I have to program a receive PL on several of my local repeater channels due to this kind of interference whch friends who have name brand radios do not.

---In baofeng_uv5r@yahoogroups.com, <greentrust@...> wrote :

But if the receiver in the baofeng works just fine for you, it's hard to justify a radio that costs more than 4x as much. If I can hear the repeater clean, and they can hear me, that's all I need.

In general, the Baofeng HTs do what I need an HT to do, not sure what a more expensive model by Kenwood or Yaesu would do, other than provide me with some unnecessary features, and many times they don't do as good as the Baofeng in terms of what I need an HT to do.

Yes, exactly.

But I look at it like this, if you must experiment, and enjoy that, what better way than an inexpensive, yet
pretty good performing radio?

Still, as far as the lowly UV-5R, it is what it is. I think we are getting a lot of performance out of them without
ever opening the cases.

Besides.... hams are cheapskates. ;-D

I agree. The bottom line is : if you want a HT for experimenting with or if you're newly licenced and want to see how stuff works or if you're on a budget or a cheapskate, the Baofengs are great to get you going. Cheap, fairly reliable and (almost) disposable. If you want a HT for more intensive work or if it needs to be semi professional or if you have the cash, then buy a more expensive one. I have a growing collection of Baofengs which are used for various purposes but when I might need a radio for more serious use I use my Yaesu FT60 or my (waterproof) Alinco DJ-V57.

Physically yes.Legally, no.
This radio is not Part 95 certified, so youcan't use it for MURS, FRS or GMRS.
Now that you know, what you do is on you.As is posted in another group,"You are responsible for the legal operation of your radio."

Fairly hot off the press….It would appear the FCC has denied the Part 95 usage and perhaps Part 90 too for the TERMN8R.

You can't find T4K-8RSERIES or T4K-QZQX3318 on the FCC site anymore…under any status at all which seems a bit weird as it would seem it should be under "denied" if that were true.

http://www.brickolore.com/2015/03/anytone-tech-termn-8r-fcc-id.html

Gotta' be a story behind that one…

Had 5 of those cheapskates in a row this last show (yesterday)- however none were hams and all thought they should get a pair of the HP versions for the same costs as Bubble pack radios. ($49 a pair)

Had to take 2 aspirins after spending an hour talking to each one of them trying to teach basic principles on how a radio works. Repeatedly telling them they cannot use on CB radio and you cannot talk to Police/Fire using one of our used trunking scanners.

I'm actually glad there were no sales as these 5 most likely could not pass the Tech class and would most likely show up somewhere unlicensed.

5 real dummies in a row was a record, usually it is a couple spread out over a weekend.

Installing chirp on a Windows 7 64 bit professional it kept complaining "For Vista users only" finally I downloaded the .zip file for the OLDER installation, then re-downloaded the installer, told it to use the .zip file location (forgot if I unzipped first, probably did), then it installed w/o complaint.

I had to download the driver for the USB cable and then install from there. It worked the first time.

I was able to download my data from the UV-54 no problem once the USB driver worked (as mentioned).

I was able to import a .csv file (after hand editing for errors from the guy who gave it to me) and make sure you SAVE not SAVE AS text file or you lose the .csv extension.

Anyhow I was able to copy and past from that to the downloaded file FROM the radio, which has the right hardware image settings. You MUST download from the radio FIRST to have the correct "blank (or not blank" slate from which to work.

To copy, from a .csv file, highlight all the lines you wanna copy FROM!
BUT THEN!! you highlight JUST the location where you want to BEING inserting - i.e. ONE LINE ONLY in the
existing image file you earlier downloaded. THAT will pase successfully, upload, operate correctly, etc.

I did this all by trial and error and intuition, but it worked. I can't say it was very diffcult.. it was not.

You can't upload directly from a .csv you just imported. You gotta move the data over (as I shows how to) to the downloaded data from the radio now existing in an adjacent tab . Then upload to radio and voila!

I tested it for functionality. Works fine!

I noted as I hadn't used the radio in ages that there is an A radio and a B radio. They can independently operate Memory or VFO, so don't get confused, as the display shows two lines - A and B. I keep memory on A (line 1) and VFO on B (line 2)

It's just easier for my small brain.

All power settings in the databases are on high (or 5 or whatever). This is how I like to run it. THis radio only goes up to 5W. Fine by me.

I'll never forget what a local HRO sales manager once told me many years ago, which was "Hams in general are really just a bunch of CB'ers, and by CB'ers, I don't mean the folks on 11 meters, I mean *c*heap *b*a$tards." *His

quote*, mind you, *not mine*.

After being involved with radios for several years, however, I'm beginning to understand how some (thankfully just a few) customers can drive you crazy. I've seen friends spend hours trolling the internet (or calling a dozen 800 numbers) to save $2.00 on a mobile radio that sells for $300 plus. Those are the folks that wear the term "dumpster diver" with pride, as they will literally jump inside a filthy dumpster to "save" a 5 foot piece of RG-58 coax that somebody else dared to throw away. They are also normally single, as most women discover their "cheap" side very early on in the relationship ....

This wouldn't have been CHIRP complaining. You probably mean the
Prolific device driver that is needed for programming cables with the
Prolific type USB-to-TTL chip. Just ignore that complaint. The
v3.2.0.0 device driver (which was originally available for Vista) is
the one that you want for Windows Vista, 7, 8, 8.1 and 10 regardless
of the "For Vista users only" message.

UV-54? I was unable to google this model. Was that a typo? Maybe UV-5R?

>
>
> I was able to import a .csv file (after hand editing for errors from the guy

When you choose File -> Save the data in the tab is saved to the same
{filename}.{extension} that is already associated with the selected
tab. CHIRP does not change it. If the tab has no file name associated
with it yet (it will display *.img or *.csv) and File -> Save is
selected, then File -> Save As will be invoked. This is standard
Windows operation.

If you are working with a CHIRP Radio Image (*.img) tab and are
choosing Save As and forcing the CSV extension, then you are most
likely saving the file with an extension the is incorrect for the
file's data type.

If you are selecting File -> Open and changing the file mask to CSV, then you aren't actually importing anything. You are just opening a CSV file in CHIRP. Import involves selecting an IMG tab and then choosing File -> Import and then choosing the CSV to import. You would then get a dialog that allows you to choose which channels in the CSV file that you want to import and also chose when channels you want them imported to. (see the link to the CSV How To below)

When you "import" you are merging the some or all of the CSV file's channel data to the currently selected tab. There would be no "copy and paste" required.

>
>
> To copy, from a .csv file, highlight all the lines you wanna copy FROM!

> existing image file you earlier downloaded. THAT will pase successfully,
> upload, operate correctly, etc.

To import a CSV file choose File -> Import, change the file mask to "CSV Files (*.csv)", choose the CSV file that you want to import, then at the "Import From File" dialog, choose which channels that you want to import and "map" them to the locations that you want them imported to. Once done with selection and mapping, click the [OK] button. Done. The channels were merged.

You can if you import the CSV file directly into a tab that is compatible with your radio (a tab that was just downloaded from your radio or an image file that was saved from your radio earlier and then loaded back into CHIRP). That's how "import" works.

You might take a look at this "CSV How To" from the CHIRP website:
http://chirp.danplanet.com/projects/chirp/wiki/CSV_HowTo

You can't do this on a UV-5R or similar radio. You must be describing
a UV-B5, UV-B6 or some variant I am unfamiliar with.

Yep describes the 5 I talked to. I bet they will show up at the next show with an Amazon bought $30 radio and expect me to program it for them and get accessories at below costs.

I'll never forget what a local HRO sales manager once told me many years ago, which was "Hams in general are really just a bunch of CB'ers, and by CB'ers, I don't mean the folks on 11 meters, I mean cheap ba$tards." His quote, mind you, not mine.

After being involved with radios for several years, however, I'm beginning to understand how some (thankfully just a few) customers can drive you crazy. I've seen friends spend hours trolling the internet (or calling a dozen 800 numbers) to save $2.00 on a mobile radio that sells for $300 plus. Those are the folks that wear the term "dumpster diver" with pride, as they will literally jump inside a filthy dumpster to "save" a 5 foot piece of RG-58 coax that somebody else dared to throw away. They are also normally single, as most women discover their "cheap" side very early on in the relationship ....

On Mon, Apr 27, 2015 at 11:31 AM, 'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Had 5 of those cheapskates in a row this last show (yesterday)- however none were hams and all thought they should get a pair of the HP versions for the same costs as Bubble pack radios. ($49 a pair)

Had to take 2 aspirins after spending an hour talking to each one of them trying to teach basic principles on how a radio works. Repeatedly telling them they cannot use on CB radio and you cannot talk to Police/Fire using one of our used trunking scanners.

I’m actually glad there were no sales as these 5 most likely could not pass the Tech class and would most likely show up somewhere unlicensed.

5 real dummies in a row was a record, usually it is a couple spread out over a weekend.

Craig wrote: "As the success of various Chinese radio vendors has shown (with Baofeng leading the way), customers will buy primarily on price and then spend hours trying to get their radio(s) to work the way the more expensive radios do, or try to hack into existence some missing feature or function."

Yes, exactly.

But I look at it like this, if you must experiment, and enjoy that, what better way than an inexpensive, yet
pretty good performing radio?

Still, as far as the lowly UV-5R, it is what it is. I think we are getting a lot of performance out of them without
ever opening the cases.

Besides.... hams are cheapskates. ;-D

If you have a GMRS license apparently you care about following the regulations, therefore you should not use this radio because it is illegal to do so.

From: mailto:baofeng_uv5r@yahoogroups.com
can i use this radio for GMRS if i have my GMRS license?

I keep getting the cancel message.
Here's an example of a frequency I want to enter. 151.715

I have the spacing set to 2.5k which seems to get me the .715 BUT

I can't get anything lower than 140.000 or higher than 150.997 VHF
(also am restricted to 430.000-440.997 UHF which is also not the full spread)
What gives? It's supposed to be from 136MHz-174MHz... VHF

Any ideas?

49836. Bandpass filter for Baofeng UV-5R

Yahoo group: baofeng_uv5r (2015)
Date: 2015-04-29 20:40:10 UTC
From: kokotov@...
Topic: 49836 Message: 49836

Hello everybody,
I was tried to connect better antenna instead original antenna to my UV-5R in order to increase working range. But I noticed that with better antenna the receiving signals was actually worse !?
(tried Nagoya 771, Nagoya 106, Nagoya 108, Diamond X-30 and home made Dipole for 2m band)
The corespondents send me a better receiving reports but, unfortunately, in most of the cases I copy them worse or not at all...

Thinking about this unexpected problem, I come to conclusion that connecting any better antenna to UV-5R,
actually you exposes the receiver front end to strong out of band signals. Especially if you live in urban area with many RF signals around, like strong FM broadcast stations and so.

The Baofeng UV-5R is wonderful little handheld transceiver with wide-band frequency range, but nothing is perfect, so UV-5R is not perfect too.

Many wide-band receivers suffering from low receiving dynamic range just because they are wide band and at their front-end (when you connect a good antenna) the receiver "see" many out of band signals as well (like strong FM broadcast signals) so they easily can block the receiver and we can not receive weak signals of interest. By the way, a good tracking filter is imposible to include in the little transceiver of that price range.

The producer equipped this little handheld UV-5R with just good enough antenna to making local contacts, and at the same time, antenna is as bad as not being blocked by strong out of band signals...

To solve this problem, I made myself a bandpass filter for 2 m band (145 MHz). Now I can connect better antenna without receiving problem. I can hits repeaters up to 100 km away !

You can check my youtube video of the details about my home made helical bandpass filter, so you can make it too:

This is a great example of two things:

1) The kind of projects that all amateur radio operators used to be capable of envisioning, designing, and building (usually building at little or no cost using parts already on hand in their "junk box")

and

2) The distinction between what you CAN do with one of these little radios if you are prepared to experiment vs what is practical to do with a $35-45 radio.

I've had no problems with my cloned Kenwoodcable. I have the right 3.2.0.0 driver on mysystem. It works with the Baofeng and Yaesu
clone cables in CHIRP.
Get the right driver installed and it works.Use the same USB port each time and it won't reinstall.

I have RT Systems cable and software (cable works great with chirp too) and love it. Much more polished and works more intuitively than chirp. Software is radio specific though.

I don't see a cable driver for the Baofeng cable?

Then when I'm in CHIRP I'm guessing I go to Radio, Download from Radio entering the Vendor and Model as well as the port.

However, the ports are all bluetooth seemingly. Maybe because I don't have the driver installed yet?

The cable did come with a mini CD but don't know what I'm looking for on it or if there is a MAC driver there?

As has been discussed before, any genuine Prolific, Silicon Labs, or FTDI cable normally runs around $20 to $25, so the RT Systems software is "about" a $25 bump (which I understand to some folks is like pulling teeth), but it can save you many hours of hair pulling "fun" trying to figure out what the heck is wrong with your programming setup.

Certainly "if" folks follow the Miklor procedures to the letter, they can eventually make their fake Prolific cables work (until they forget which Port to plug into, or Microsoft does another driver or software update without your knowledge, etc.

I like that I can actually talk to the RT Systems programmers on the phone in Colorado, ask them about adding new features to an existing program, or even help convince them to add another radio model to their extensive product line-up (which they have done several times for me) - without waiting months for someone to purchase a radio and send it to the Chirp folks as a loaner, but I also get the fact that many of the folks on this forum are extremely knowledgeable about getting the various freeware options to work and that if you have many different models of radios (from different manufacturers) "free" will always cost less than any paid product (no matter how well the paid program works).

For some folks, however, time is money, plus there are still things you can do much more easily within RT Systems products than with various freeware software options.

Or.... God help me and my hillbilly ways... but I took one of those fake 3800 battery car charging cords, cut the end off of it, then drilled a hole in the side of a UV-5R battery eliminator, soldered it to the contacts on the inside of the eliminator, snapped it all back together, and BAM! Charge the 3800 battery, or run a radio off the eliminator, or both.

And it works putting out only 8.1V, but that's better than nothing, and every once in a while I'll cycle the 3800 batteries on the home charger. So yeah, it's hillbilly, but it was inexpensive and it works.

I just bought UV-5R Baefeng. I have two portable antennas. There is a shorter one, and the other is twice as long. My question is:
I'm only interested on receiving (i don't transmit) on different frequencies. Does the antenna length matter for reception? I'm only interested to have most reception and i do not transmit. Hope to hear ideas.

Yes,the more antenna you have the better it will receive.Do you want it to mount on the HT or use as a base antenna. Bob AF2Q

The antennas are 3 inches and 6 inches long. I want portability and these antennas connect directly to my HT. I have no base station setup.

So i read that the best antennas for me would be NAGOY NA-701. I will check if that is in local stores.
Another question:

I don't transmit, and i only recieve. Is having shorted 3 inches antenna consuming more battery power?

You only use more battery power if you always keep the volume cranked up. Antenna does not use battery power but those short stub antennas are the pits Bob AF2Q

Hello everybody,
I was tried to connect better antenna instead original antenna to my UV-5R in order to increase working range. But I noticed that with better antenna the receiving signals was actually worse !?
(tried Nagoya 771, Nagoya 106, Nagoya 108, Diamond X-30 and home made Dipole for 2m band)
The corespondents send me a better receiving reports but, unfortunately, in most of the cases I copy them worse or not at all...

Thinking about this unexpected problem, I come to conclusion that connecting any better antenna to UV-5R,

actually you exposes the receiver front end to strong out of band signals. Especially if you live in urban area with many RF signals around, like strong FM broadcast stations and so.

The Baofeng UV-5R is wonderful little handheld transceiver with wide-band frequency range, but nothing is perfect, so UV-5R is not perfect too.

Many wide-band receivers suffering from low receiving dynamic range just because they are wide band and at their front-end (when you connect a good antenna) the receiver "see" many out of band signals as well (like strong FM broadcast signals) so they easily can block the receiver and we can not receive weak signals of interest. By the way, a good tracking filter is imposible to include in the little transceiver of that price range.

The producer equipped this little handheld UV-5R with just good enough antenna to making local contacts, and at the same time, antenna is as bad as not being blocked by strong out of band signals...

To solve this problem, I made myself a bandpass filter for 2 m band (145 MHz). Now I can connect better antenna without receiving problem. I can hits repeaters up to 100 km away !

You can check my youtube video of the details about my home made helical bandpass filter, so you can make it too:

Yes, this will charge your battery. But it won't detect when your battery is fully charged and shut off. That is the critical piece that is missing from this, as you've called it, "hillbilly" setup.

Thanks Jim for creating the warning on Lipo's. We use a lot of them in model airplanes and are very aware how dangerous the Lithium Ion and Lithium Polymer are. Ions are simply "hard cased" Polymers. I get anxious every time I see a Email that indicated a Baofeng owner is not aware. Especially if the person doesn't have a phone with 911 already to dial when he is in a panic.
Charging Lipo's with anything other the proper Lipo charger is not advisable at any time. The visible warning is swelling. Modelers immediately take them out of service and discharge those with a resistive load which makes them inert/harmless and then recycle. Ions being hard cased are not used in Models and I have no experience with uncontrolled charging them. Swelling might be contained by the case until a violent rupture and flame occurs with no warning. That I have witnessed in non hard cased packs. Usually it happens while charging and something has been screwed up in setting the charging perimeters.
Modelers using "soft" packs try very hard to always charge a Lipo pack in a non flammable container treating them as if they could burst into flame at any time. I use a big coffee cup. Many even store/handle/carry them in a non flammable container, each pack separated. A very wise move for non- hard cased Lipo's. Some Lipo types are not dangerous like the Li-Fe's.
The supplied chargers are as safe as they come. The LED on one cradle I have went out. I replaced it with a 1/2 inch three digit panel type DC voltmeter bought on Ebay for $1.25. Shipped! Now I can watch the numbers and know what's going on. As a general rule you will get more cycles by never charging past 4.1 volts per cell measured when off the charger. The UV 5R is a 2 cell Ion pack. I try to charge way before the little radio says in Chinese "Low Battery" that sounds like @#$%^&* or something like that. See the Battery University online for technical details. Be ready to spend some time! 73 Ken wa6ivd

I haven't tried the Nagoya NA-701 antenna. From what I can find on internet, NA-701 is smaller than NA-771. You have to try it yourself. I suggest you to stay with original antenna unless you are in rural area, far from strong RF signals...
Otherwise, you should use a bandpass filter (to avoid interference) and some mobile antenna on the roof of the car for mobile use.

Simple answer is that the original UV-5R (and it's various cousins) have a wider than average barn door for a front end to the receiver, which means that if you live in (or near) a higher than average RF environment, any transmit improvement (with the better antenna) will also come with more RF overloading a very sensitive (but not very selective) receiver. Now if you live miles from any other neighbor you'll probably live the improve on both transmit and receive, but if not, the receiver overload will drive you nuts.

I dunno if i'm in a high RF environment but i scan using the diamond RH-775 antenna and I don't hear any that much noise reception. So like what i said, i test i dont get conclusive. Except for the fact the longer the better. Thats what i think and i bought.

From: truth adjustr
Topic: 49869 Message: 49869

The antenna is marked or labelled as "144/430Mhz", yet when i listen to frequency above than 430Mhz it can still receive. Any commments?
As I googled, the spec is:Connector:BNC-P / Type:1/4wave(144MHz),1/2 radilalless(430MHz),120/150/300/450/800/900MHz for receiving only

What does the "receive only" phrase means? Are those exact receive frequencies? Like, i can still receive 800Mhz? But not 820Mhz? Please help me understand. Thank you.

It's designed to have best performance in those two bands. That doesn't mean that it won't work at all at other frequencies. It just won't work as well.

From: Roger Elmore
Topic: 49869 Message: 49871

The 144/430 is the frequency bands the antenna is designed to transmit on without damage to the radio. The RH-775 is designed to transmit safely on the 2M (144.0MHz to 148.0MHz) and 70cm (420MHz to 450.0MHz) Amateur Radio frequencies.

Receiving can’t (normally!) cause damage to your radio, if you have a bad antenna or one that isn’t tuned for a particular frequency of interest, you (normally!) just won’t be able to pick up transmissions as well. The frequencies listed in the “receive only” range are a point of reference to the radio services they’re allocated to:

http://www.ntia.doc.gov/files/ntia/publications/2003-allochrt.pdf

So, similar to the 144 in the Transmit actually being 144MHz - 148Mhz, the 120 in the Receive is the 110MHz - 130MHz allocation, the 150 is the 130MHz – 160MHz and so on.

Make sense?

truth adjustr wrote:

The antenna is marked or labelled as "144/430Mhz", yet when i listen to frequency above than 430Mhz it can still receive. Any commments?

As I googled, the spec is:
Connector:BNC-P / Type:1/4wave(144MHz),1/2 radilalless(430MHz),120/150/300/450/800/900MHz for receiving only

What does the "receive only" phrase means? Are those exact receive frequencies? Like, i can still receive 800Mhz? But not 820Mhz? Please help me understand. Thank you.

I haven't tried that specific antenna, but a wire coat hanger stuck in the antenna jack is better than the stock antenna, so likely so.

I jest, well sort of...

I can vouch for that! I do NOT live in a high RF area, but when I hook mine up to a j-pole 15 feet in the air I receive stations off freq by .200Mhz almost as well as the selected freq.
I have to put receive CTCSS codes on about half my channels just to keep out the adjacent stations when on the j-pole. Selectivity is abysmal on these units. But for $30...

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

Simple answer is that the original UV-5R (and it's various cousins) have a wider than average barn door for a front end to the receiver, which means that if you live in (or near) a higher than average RF environment, any transmit improvement (with the better antenna) will also come with more RF overloading a very sensitive (but not very selective) receiver. Now if you live miles from any other neighbor you'll probably live the improve on both transmit and receive, but if not, the receiver overload will drive you nuts.

Transmitting is a matter of ERP (Effective Radiated Power).

Receiving is a matter of SNR (Signal to Noise Ratio).

Noise on any particular antenna setup is relatively constant. Swapping antennas can, obviously, change

So for transmitting you get this basic idea:

Transmitter -> Cabling -> Antenna -> ERP -> Atmosphere -> Signal+Local Noise @ Antenna -> Cabling -> Receiver

High SWR can kill your ERP as all that's being transmitted (hopefully) is just signal with virtually zero noise. So any degradation of signal level will affect what all other receivers can see.

The receiver, however, is getting Signal+Noise (most of the noise is coming in the antennal…again hopefully). The same SWR in a receiver reduces BOTH components so the ratio (i.e. dB) remains the same even if you lose 99% of the signal as you also lose 99% of the noise too.

Any antenna can receive any frequency due to the receiving function being SNR based. That's why shortwave receive-only radios work with a 3 foot extendable antenna over all bands.

Sorry I don't have my extendable with me and I can't remember the numbers but, I have a 5/8 retractable that works excellently! the only thing I use that out proforms it is my roll-up SlimJim. I hear all the QRM about the overloded front ends and have never expearanced it. I also own and swop using 8 Baofeng/Pofengs. and I always get great signal reports.

From: Mile Kokotov
Topic: 49866 Message: 49879

I was tried to connect better antenna instead original antenna to my UV-5R in order to increase working range. But I noticed that with better antenna the receiving signals was actually worse !?
(tried Nagoya 771, Nagoya 106, Nagoya 108, Diamond X-30 and home made Dipole for 2m band)
The corespondents send me a better receiving reports but, unfortunately, in most of the cases I copy them worse or not at all...

Thinking about this unexpected problem, I come to conclusion that connecting any better antenna to UV-5R,

actually you exposes the receiver front end to strong out of band signals. Especially if you live in urban area with many RF signals around, like strong FM broadcast stations and so.

The Baofeng UV-5R is wonderful little handheld transceiver with wide-band frequency range, but nothing is perfect, so UV-5R is not perfect too.

Many wide-band receivers suffering from low receiving dynamic range just because they are wide band and at their front-end (when you connect a good antenna) the receiver "see" many out of band signals as well (like strong FM broadcast signals) so they easily can block the receiver and we can not receive weak signals of interest. By the way, a good tracking filter is imposible to include in the little transceiver of that price range.

The producer equipped this little handheld UV-5R with just good enough antenna to making local contacts, and at the same time, antenna is as bad as not being blocked by strong out of band signals...

To solve this problem, I made myself a bandpass filter for 2 m band (145 MHz). Now I can connect better antenna without receiving problem. I can hits repeaters up to 100 km away !

You can check my youtube video of the details about my home made helical bandpass filter, so you can make it too:

Roger,

Xuan can sometimes come off a bit harsh, but generally he is knowledgeable about the radio communications field. His issue (I believe) is one of patience (many of the same questions asked thousands of times would drive anybody with an IQ above 100 a little crazy). The other issue he has - IMHO (as well as many others) - is one of the ever shrinking minimum knowledge level in this communication hobby. We could certainly have an interesting discussion if this also ties into the dumbing down of America (http://en.wikipedia.org/wiki/Dumbing_down) as our students graduate without being able to even make change (without a computer) or as one ASU college graduate once told me, "the Statue of Liberty isn't on an island, it's too big and heavy and would sink", but that's a debate for another forum.

In days gone by, you actually had to have some level of basic knowledge about radio, electronics, communication theory, etc., *BEFORE* you got your license - now we have folks that memorize the Tech exam (with answers that are given in advance), pass with 26 correct answers out of 35, and have zero knowledge about how their radio works (or the repeaters behind it), so they come up on forums like this to ask what Xuan probably considers 1st grade level questions.

To use an example that most could relate to, imagine your auto mechanic asking public forum questions about where the oil goes in your car as you pull up next in line, it probably would not be a place most of us would feel comfortable taking the car in for head gasket work.

Not that the lack of knowledge is solely a Technician level issue, either. I've had General Class license holders ask me if we sell an adapter that allows their DC based power cable (from their mobile radio) to be plugged directly into their AC outlet at home. Even when I explained that "adapter" was called a power supply, they walked away with a puzzled look - as if they didn't believe it would take all of that extra "stuff" to get power from their wall outlet to their radio. I've also had Extra Class hams that couldn't properly solder a simple PL259 and wonder why their HF dipole coax cable keeps coming down with a small amount of wind (literally their coax fell down with the PL259 still attached to their dipole hanging in the air - TWICE).

I've seen Xuan go out of his way to patiently explain simple concepts to folks, so perhaps it was just one of those days where his patience was near the breaking point and he just let off some stream. I'd suggest you find an "Elmer" in your area to help you learn the basics, but we do have one troll on this forum (based in NYC) that still thinks I made the term "Elmer" completely up on my own (http://en.wikipedia.org/wiki/Amateur_radio or http://www.na0tc.org/Tech_Elmer.html) because he had never heard of it.

Roger,

Xuan is a member of this group whom many have chosen to ignore outright. This is a pity, as he has considerable technical knowledge and can usually be assumed to "know whereof he speaks".

He does not aspire, however, to become a career diplomat, labor dispute negotiator, school teacher,... perhaps any calling that involves dealing with people. His "answers" to legitimate if occasionally naive questions are sometimes abrupt, condescending, and in my opinion immature. His comment to you Roger was "unhelpful" to say the least.

I'm sure every licensed ham here has pockets of expertise and experience, and the occasional isolated pocket of ignorance. I think it's important that this forum be a place of safety where you can ask for direction, (or simply "opinions", as you had done), without being subject to grade school insults in lieu of useful information.

I hope that you Roger, continue to learn and grow, as I and all hams aspire to do.

And I hope that Xuan finds a decaffeinated brand that he likes, and continues to favor us with his technical skill.
Ian VA3IGB

When I passed my novice exams some 40 years ago, one of the things we (it was a JHS class in basic electronics) were taught was basic courtesy interaction. When I upgraded to tech class and started to chat on UHF repeaters, everyone still conducted themselves as adults, not school children who can come up with the best insults. To this day, the repeaters I chat on, if some of the people I ignored on this forum said those things on the air, the repeater officers would shut down the repeater on them. Mature conversation amongst adults is nice. Insulting people belongs on the 11 meter band, not the ham bands.

I bought my first programmable HT decades ago. They all had the same basic way of programming. When I got the Baofeng, it did things differently. So I asked for some help. Some referred me to the miklor website. Some answered me and made me understand the difference in programming methods. Others had to qualify me.. did I pass a code test, study the answers only... etc, before they decided to answer me. A tech class license is a tech class license whether he passed a code test 20 years ago, or passed it 2 days ago without the code requirement.

The nature of Yahoogroups is, you have new people joining all the time. So the same question is asked once every two weeks. So what. Does that mean the person should be told.. hey dummy.. look at the group archive for the answer, its been answered a 100 times already. Is that a answer that leaves someone warm and fuzzy with members of this group?

Bruce

Roger,

Xuan is a member of this group whom many have chosen to ignore outright. This is a pity, as he has considerable technical knowledge and can usually be assumed to "know whereof he speaks".

He does not aspire, however, to become a career diplomat, labor dispute negotiator, school teacher,... perhaps any calling that involves dealing with people. His "answers" to legitimate if occasionally naive questions are sometimes abrupt, condescending, and in my opinion immature. His comment to you Roger was "unhelpful" to say the least.

I'm sure every licensed ham here has pockets of expertise and experience, and the occasional isolated pocket of ignorance. I think it's important that this forum be a place of safety where you can ask for direction, (or simply "opinions", as you had done), without being subject to grade school insults in lieu of useful information.

I hope that you Roger, continue to learn and grow, as I and all hams aspire to do.

And I hope that Xuan finds a decaffeinated brand that he likes, and continues to favor us with his technical skill.

This is exactly true. Diamond is in Oceanside CA, not far from me.

I have talked to the owner and relatives of the company which reported these are indeed fake. The real Diamond’s are not cheap and most $30 dollar buyers of the Uv5R will not want to spend $ for them.

While many of these fake antennas will work at a much cheaper price, Diamond’s owner told me if the radio body gets hot that is a sure sign of a bad antenna.

I advised my reps in China not to send me any Diamond marked antennas.

The RH775 is BNC. The entire RH line is BNC.
If yours is SMA it is a fake.
Is the diamond shape in the logo a triangle instead of a diamond? Fake
It is difficult to buy a real diamond antenna on ebay.

A bit of common decency goes a long way - I was supportive of some new trainees about twenty years ago - they were mostly ignored by everybody else - one of those remembered my kindness ten years later when he had climbed all the way to the top and was 'in charge', he gave me a ton of work as a result. thank you! :-)

What goes around comes around - Karma :-)

I'm not a Christian, but treat others the way you wish to be treated yourself.

Some members of this group have been brilliant when I have asked noob questions, yes it is all there on the Miklor website, and it is a great resource, but it isn't the easiest website to find things on, I'm getting used to it now :-)

Enjoy your new radio, it isn't the best radio on the market, but it is a lot of fun for less than £25, a round of beers would cost more than that here in the UK.

I love some of the suggestions here - I am very tempted to make a bandpass filter next.

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Diamond RH-775

Roger,

Xuan can sometimes come off a bit harsh, but generally he is knowledgeable about the radio communications field. His issue (I believe) is one of patience (many of the same questions asked thousands of times would drive anybody with an IQ above 100 a little crazy). The other issue he has - IMHO (as well as many others) - is one of the ever shrinking minimum knowledge level in this communication hobby. We could certainly have an interesting discussion if this also ties into the dumbing down of America (http://en.wikipedia.org/wiki/Dumbing_down) as our students graduate without being able to even make change (without a computer) or as one ASU college graduate once told me, "the Statue of Liberty isn't on an island, it's too big and heavy and would sink", but that's a debate for another forum.

In days gone by, you actually had to have some level of basic knowledge about radio, electronics, communication theory, etc., BEFORE you got your license - now we have folks that memorize the Tech exam (with answers that are given in advance), pass with 26 correct answers out of 35, and have zero knowledge about how their radio works (or the repeaters behind it), so they come up on forums like this to ask what Xuan probably considers 1st grade level questions.

To use an example that most could relate to, imagine your auto mechanic asking public forum questions about where the oil goes in your car as you pull up next in line, it probably would not be a place most of us would feel comfortable taking the car in for head gasket work.

Not that the lack of knowledge is solely a Technician level issue, either. I've had General Class license holders ask me if we sell an adapter that allows their DC based power cable (from their mobile radio) to be plugged directly into their AC outlet at home. Even when I explained that "adapter" was called a power supply, they walked away with a puzzled look - as if they didn't believe it would take all of that extra "stuff" to get power from their wall outlet to their radio. I've also had Extra Class hams that couldn't properly solder a simple PL259 and wonder why their HF dipole coax cable keeps coming down with a small amount of wind (literally their coax fell down with the PL259 still attached to their dipole hanging in the air - TWICE).

I've seen Xuan go out of his way to patiently explain simple concepts to folks, so perhaps it was just one of those days where his patience was near the breaking point and he just

let off some stream. I'd suggest you find an "Elmer" in your area to help you learn the basics, but we do have one troll on this forum (based in NYC) that still thinks I made the term "Elmer" completely up on my own (http://en.wikipedia.org/wiki/Amateur_radio or http://www.na0tc.org/Tech_Elmer.html) because he had never heard of it.

Then that’s the day to back away from the keyboard and take a break. Let someone with the patience answer the question.

FWIW, I’m not the OP with the antenna question, I’m the guy Xaun told putting a 10VDC regulator ahead of a CH-5 PCB for 13.8VDC input, and the 8.4VDC output of the PCB to the coaxial jack of a BL-5L wouldn’t work. He was wrong then too.

Topic: 49897 Message: 49898

The damage would happen when you transmit. What frequencies are you licensed to transmit on?

I put a RH-519 clone on my MFJ-269Pro antenna analyzer and it read fine for transmitting on Amateur Radio frequencies, but when checked for Part 90 LMR frequencies it didn’t look so hot. So I use the RH-519 on my Amateur radios. I tested the 4” and 6” Baofeng antennas and they read fine for transmitting on both Amateur and the LMR frequencies, so I use the 6” on the UV-5R, which I bought for LMR.

No. I just never use a telescopic model. Those will fry a radio.

Yes, Roger, in a perfect world we'd all be kinder and have unlimited amounts of patience and tolerance towards others, I agree. I'm sure Xuan (in hindsight) would probably agree as well, but the problem with public forums (in general) is that anyone with computer access can also leave answers (or make misleading statements) that simply aren't true and they don't like being corrected.

Xuan's issue (IMHO) is that he tends to cut to the quick instead of providing a more nuanced answer to the new users, but in his defense, very few of them even bother to look at the miklor site first to see if their question(s) have already been answered a hundred times over.

It's easy to say that one should always treat each new version of the same question with the same high degree of patience and understanding as the first time you've heard it (and many new users or those new to the hobby would agree), but after several years or answering the same question over and over I wonder if their patience and understanding won't slip a little from time to time as well?

In any case, it's time to move on with this subject, as I doubt this discussion will change many minds (on either side of the debate).

Yes, it's always "risky" to use a clone (or fake) of almost any product, the risk level is what needs to be taken into consideration (and it's intended use) vs. the money being spent. For example, a fake antenna may have a high SWR, poor performance, and over time, could actually damage the radio (again depending on how bad the fake was made and how long you use it, what power level, etc.).

I'd certainly test it before counting on it to work properly, but the problem is most new Baofeng owners don't have the proper test equipment or they rely on other new Baofeng owners (neither of which have a real S-meter) to tell them how strong a signal they have. (In case you haven't noticed, your Baofeng S-meter will always show 5 bars, never anything less, no matter how weak the signal).

Fake programming cables can still be made to work (usually), it's just how much time and effort you want to waste getting the cable to work.

In the end, it's usually like your mother told you all those years ago, "if it looks too good to be true, it probably is".

Hell I wish I could find and hire a Xuan type person here that could deal with the dip-sticks and gang members that seem to want to buy radio stuff or bring us radio stuff to monitor or screw with Law Enforcement. I get sick of dealing with them. I do not mind explaining radio stuff to a father that wants to get his family all licensed in case we have a major Earthquake or other event here. However, after explaining Ham radio and then having a potential buyer only wanting the radio to either talk or monitor the police (after wasting my time) does not make a good day.

I had at least 10 of these this last weekend.

They are even too cheap to buy the trunking scanners we sell for $150 too. No reason to want a radio to TALK to the police at all.

I even joked with the Cops that were on duty at the event to sit at my table and when the gang members come up to ask them “How can I help you.”

My Xuan employee could get rid of them quickly but also give good tech advice to the serious people either licensed or not.

I take them and test them and mark the sweet spots with paint spots to indicate the stops for the bands in use. This seems to help and works well for Tri-band radios.

If the antenna is resonant, it simply doesn't matter a bit if it's a telescoping design or not. Now if you insist on using a telescoping antenna only part way pulled out, and thus not resonant for the frequencies it's designed to work on, then yes your SWR will be much higher than it was designed for and not work correctly.

The flat out statement that telescopic antennas "will fry a radio" is non-correct. What would be correct is to say that if you use any antenna on frequencies that they are not designed for, or to not use the telescopic antenna correctly (fully extended or fully contracted), then that may cause much higher than normal SWR since the new antenna (only half extended for example) is not resonant for the frequencies your radio (and that antenna) was designed for.

Years ago AEA made several single band BNC mount extendable antennas that work very well (I still have several), but unless you are very careful with your measurements you should not take their 2m antenna and try to work 220MHz with your tri-band radio.

Rich,

Be sure to add my latest weekend prospect to your new book "*Buying Chinese Radios for Dummies*", as he wanted to simply take the red/black zip power cord (directly attached to the back of a TYT mobile) and get an "adapter" (like a Simpson 48-521B) to connect the two dc wires directly into his wall outlet at home (no joke). He didn't believe me a bit when I explained the need to change the AC to DC using a power supply. The truly sad part was he was a General Class.

I admit, I did give some thought to sending him over to Home Depot and allowing his actions later that night to improve the overall gene pool, but I was good, so if I read his SK announcement in QST sometime soon I'll know he didn't take my advise after all....

You're right about Xuan, sometimes it would be nice to have folks like that working the booth, but Booth Babes do tend to attract more folks to the tables.

From: Nicholas Papadonis
Topic: 49909 Message: 49909

Folks,

I have had my BF-F8HP since September 2014. I'm noticing recently that many of the local repeaters I used to hear clearly now have significant static. I'm located in the same spot where the radio was originally tested to receive clearly. Therefore, I'm wondering if the receive end of this radio has had trouble or develops trouble over time.

Thanks,
Nick

LOL

Yea need to find a DD booth babe that knows something about radios.

They do this in Vegas at the shows, here should work too but... need to find one that is Hispanic and a Gang Member type for shows around here.

Rich,

Be sure to add my latest weekend prospect to your new book "Buying Chinese Radios for Dummies", as he wanted to simply take the red/black zip power cord (directly attached to the back of a TYT mobile) and get an "adapter" (like a Simpson 48-521B) to connect the two dc wires directly into his wall outlet at home (no joke). He didn't believe me a bit when I explained the need to change the AC to DC using a power supply. The truly sad part was he was a General Class.

I admit, I did give some thought to sending him over to Home Depot and allowing his actions later that night to improve the overall gene pool, but I was good, so if I read his SK announcement in QST sometime soon I'll know he didn't take my advise after all....

You're right about Xuan, sometimes it would be nice to have folks like that working the booth, but Booth Babes do tend to attract more folks to the tables.

On Tue, May 5, 2015 at 3:19 PM, 'R Pryor MAEd CETsr' doopsnoop@cros.net [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Hell I wish I could find and hire a Xuan type person here that could deal with the dip-sticks and gang members that seem to want to buy radio stuff or bring us radio stuff to monitor or screw with Law Enforcement. I get sick of dealing with them. I do not mind explaining radio stuff to a father that wants to get his family all licensed in case we have a major Earthquake or other event here. However, after explaining Ham radio and then having a potential buyer only wanting the radio to either talk or monitor the police (after wasting my time) does not make a good day.

I had at least 10 of these this last weekend.

They are even too cheap to buy the trunking scanners we sell for $150 too. No reason to want a radio to TALK to the police at all.

I even joked with the Cops that were on duty at the event to sit at my table and when the gang members come up to ask them “How can I help you.”

My Xuan employee could get rid of them quickly but also give good tech advice to the serious people either licensed or not.

Yes, Roger, in a perfect world we'd all be kinder and have unlimited amounts of patience and tolerance towards others, I agree. I'm sure Xuan (in hindsight) would probably agree as well, but the problem with public forums (in general) is that anyone with computer access can also leave answers (or make misleading statements) that simply aren't true and they don't like being corrected.

Xuan's issue (IMHO) is that he tends to cut to the quick instead of providing a more nuanced answer to the new users, but in his defense, very few of them even bother to look at the miklor site first to see if their question(s) have already been answered a hundred times over.

It's easy to say that one should always treat each new version of the same question with the same high degree of patience and understanding as the first time you've heard it (and many new users or those new to the hobby would agree), but after several years or answering the same question over and over I wonder if their patience and understanding won't slip a little from time to time as well?

In any case, it's time to move on with this subject, as I doubt this discussion will change many minds (on either side of the debate).

Then that’s the day to back away from the keyboard and take a break. Let someone with the patience answer the question.

FWIW, I’m not the OP with the antenna question, I’m the guy Xaun told putting a 10VDC regulator ahead of a CH-5 PCB for 13.8VDC input, and the 8.4VDC output of the PCB to the coaxial jack of a BL-5L wouldn’t work. He was wrong then too.

Short answer is yes as any electronic item can degrade over time. In such a short time?? I would think perhaps not.

I would look at other possible issues such as the antenna connection. Do you regularly remove the antenna for various reasons? Bad connection?? Possible. Something broke inside the radio or in the Antenna?

Could also be atmospheric issues or dozens of other possibilities issues besides the radio's receiver becoming desensitized. I would look at the obvious before thinking about possible radio going bad.

Looking in my crystal ball, I would think the center connection wasn't making 100% contact and over time the area became pitted, making a slight insulation between the connections. Best guess. If you don't remove the antenna.. ever.. try to reseat (remove and connect) it on the radio. Working in low voltage Telco world, it can take 6 or so months for a poor connection to make its presence known.

you should give us more info, UHF vs VHF? using the stock antenna or connecting it to a mobile or base antenna? Approximate distance between you and the repeater?

Subject: [baofeng_uv5r] Does receive sensitivity change over time?

Folks,

I have had my BF-F8HP since September 2014. I'm noticing recently that many of the local repeaters I used to hear clearly now have significant static. I'm located in the same spot where the radio was originally tested to receive clearly. Therefore, I'm wondering if the receive end of this radio has had trouble or develops trouble over time.

Thanks,
Nick

If you can live with the 5 character alpha-numeric naming of channels (with

the B5/B6 series), live without an extended battery or battery shell pack
option (with the B5/B6 series), and live with only 99 memories (with the
B5/B6 series), then you'll like the far better receiver in the B5/B6 series
of radios. There may be other differences as well, but those are the 3
that most folks have issues with in my group.

I have had some Nagoya fakes (NA771, NA701) sold as genuine by Baofeng Tech fall short in field testing (no fancy meters/$) compared to the cheap Gloss black/Blue Sticker fakes. Cannot speak to SWR...

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

Yes, it's always "risky" to use a clone (or fake) of almost any product, the risk level is what needs to be taken into consideration (and it's intended use) vs. the money being spent. For example, a fake antenna may have a high SWR, poor performance, and over time, could actually damage the radio (again depending on how bad the fake was made and how long you use it, what power level, etc.).

I'd certainly test it before counting on it to work properly, but the problem is most new Baofeng owners don't have the proper test equipment or they rely on other new Baofeng owners (neither of which have a real S-meter) to tell them how strong a signal they have. (In case you haven't noticed, your Baofeng S-meter will always show 5 bars, never anything less, no matter how weak the signal).

Fake programming cables can still be made to work (usually), it's just how much time and effort you want to waste getting the cable to work.

In the end, it's usually like your mother told you all those years ago, "if it looks too good to be true, it probably is".

Thanks for the reply. Yes, I could live without those things, so the B5 or B6 sound like they may be the way to go.

Does the B6 have the alarm function on it? That is definitely one feature I would love to NOT have.

One might ask where you bought your UV-5R. Seems a lot of rejects are being flogged about.

And how long have you had the radio?

If it was like this from day one you got a lemon.

Mike W9MDB

From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@yahoogroups.com]
Sent: Wednesday, May 06, 2015 9:59 AM
To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] A/B switch stops Receiver from working in both Frequency & Channel mode.

Problem:

A/B switch seems to disable the receiver, have to push V/M button to re-enable receiver.

TX continues to work -- it is NOT affected by the A/B button, so this means you can transmit, unkey, and have a dead receiver. Not very useful.

Once the A/B button is used, you can't monitor for activity or hear anything if the radio receives a signal.

Pushing V/M twice puts the radio back in the selected Frequency or Memory mode, and enables the receiver. This really renders the radio almost useless.

Background:

I have a UV5-RA model, if I use the A/B button to change active frequencies or channels (frequency mode or channel mode) the receiver stops, the monitor button does what you describe, no audio or white noise.

Use A/B Switch to change active display (top or bottom frequency) -- Receive audio stops working.

Note: Does NOT matter whether in Frequency mode or Channnel mode.

Now push V/M (frequence (VFO) / Memory switch)

Audio works again.

Push A/B to change active transmit (top or bottom) - Audio disappears again.

Push V/M twice, audio returns.

Is this a fundamental design failure, a firmware issue, a programming issue ??

Anyone know?

Jeff, W6FCC

BUT...

You can take an older UV-5R and dump the channels TO the UV-5X. I've been doing that for a while. I have an older BF-F8+ which I program, then take it and the cloning cable and dump channels to my other Baofengs. Haven't had a problem yet.

"I had someone bring one of those back to the table after buying one last month."

Rich,

Remember my previous idea of placing a small QR code inside the radio using a laser? It looks like we'll be picking up Universal Laser products later this month, so perhaps we'll start using one to mark our radios prior to selling them. At least it will be fun to watch the looks on the faces of "some" customers when we scan the inside of their radios!

Jeff,

Do you use CHIRP to program this radio? If yes, which version?

If yes, and the version is the v0.4.x stable build or a daily build
prior to September 2014, did you directly upload a CHIRP Radio Image
(*.img) file into it that came for another radio?

Of all of the Baofeng radios I have, if I had to get rid of one, it would be the UV-B5. Too many bugs and shortcomings that have already been mentioned. Some of these bugs may have been fixed over the last two years (I'm not buying another one to find out). But those that like it, really seem to like it.

And to answer your question, the UV-B5 has the rotary encoder and alarm, the UV-B6 replaces these two items with a flashlight.

The CHIRP rule is to always download the latest daily snapshot from here:

http://trac.chirp.danplanet.com/chirp_daily/LATEST/

For some reason the package on the main page hasn't been updated since Oct 2014 and many changes (like preventing uploading a wrong image) have been fixed since then.

OK. That helps solve the problem.

What you have done is programmed one or more of your channels with a receive CTCSS tone or DCS code. When you have done this, you will see a CT or DCS displayed in the left status display. When you have a receive CTCSS tone or DCS code programmed, your receiver will remain closed (you won't hear anything) until a signal is received from a station that is transmitting the matching CTCSS tone or DCS code. That is what CTCSS tones and DCS codes are for, selective reception.

When you switched between the top and bottom display with the [A/B] key, whichever display had the channel with the receive CTCSS tone or DCS code would be silent, as it should be.

Also, when you switched to VFO mode, you probably had menu 10 (R-DCS) and menu 11 (R-CTCS) set to OFF so you would hear everything on the selected frequency.

Performing the menu 40 (RESET) cleared the programmed channels (and the channel(s) with the receive CTCSS tone or DCS code requirement.

Do what Mike said and get the latest Daily Build of CHIRP. The v0.4.x stable build is now over 1 year old and it only stable for the radios that were available 13 months ago and haven't had any changed done to them in the last 13 months. The Baofeng radios have had many changes (most in the last 6 months) so it is very important to use the daily build.

And only program transmit CTCSS tone or transmit DCS codes to start out with. Don't program any receive CTCSS tones or receive DCS codes until you fully understand why you would need them. OFF always works. Programming the wrong tone or code or a tone or code when none is transmitted and your radio will be deaf.

Easy enough to do yourself with CHIRP….menu Radio/Import and pick your datasource.

Mike W9MDB

Subject: RE: [baofeng_uv5r] A/B switch stops Receiver from working in both Frequency & Channel mode.

Mike,

Thanks for that info on the latest version. I'll save the link, or be sure to look for the latest.

So how do I find these "image" files that have pre-programmed settings? I heard there is one for San Diego repeaters somewhere, is it something posted by the CHIRP site, or does some other site have these?

I note that here are some files here in the FILES section, and if that's the best collection, I'll use those. I can program the local repeaters in South Orange County and upload that. I used to be the trustee of SOARA (South Orange Amateur Radio Association) repeaters years ago when my callsign was WA4EGT and the system now has numerous repeaters.

I had no idea that this group was so active, and I greatly appreciate all the help. I just got my friend in New York, WZ2D to signup for this group, hopefully he'll get the necessary ACK to actually contribute.

PS: I'm working on using one of these USB to Serial cables to run my PkGOLD and KaGOLD software for digital modes (TNCs) for AEA and Kantronics TNCs. It's interesting that DOSBOX works on my Apple MacBook and on WIndows 7-64 and Windows 8 to allow old 16-bit software to run on these 64-bit systems, and on Apple and Linux.

Jeff, W6FCC (formerly WA4EGT)

If you get files from somewhere else, don't try to upload them directly to your radio. Either import them or copy and past them to a tab that was created from your radio.

You can also query the RepeaterBook data base instead of looking for another file.

"I had someone bring one of those back to the table after buying one last month."

Rich,

Remember my previous idea of placing a small QR code inside the radio using a laser? It looks like we'll be picking up Universal Laser products later this month, so perhaps we'll start using one to mark our radios prior to selling them. At least it will be fun to watch the looks on the faces of "some" customers when we scan the inside of their radios!

Scott, do you have a 5RA and does the A/B button stop the receiver ?

Thanks for your help

49942. Baofeng UV-5RA+ as Marine Transceiver with NOAA Weather Channels?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-07 02:26:52 UTC
From: oldbuoy@...
Topic: 49942 Message: 49942

I recently got two nice Baofeng UV-5RA+ units in yellow and blue running what I think may be BFS297 firmware. My needs right now are pretty simple: I hope to set them both up as backup Marine VHF https://en.wikipedia.org/wiki/Marine_VHF_radio transceivers with the 7 NOAA Weather Channels http://www.nws.noaa.gov/nwr/coverage/station_listing.html (preferably as "receive only") as well.

I managed to get the correct Prolific drivers (2.1.51.238) correctly installed on my ancient Alienware m9700 laptop that's still rockin' Windows XP Pro thanks to Miklor.com's excellent guide, and also the latest daily build of CHIRP as of a few weeks ago (ver. 20150416).

I am not sure if I correctly followed all of the tips I've found on this forum and in the great little "Baofeng UV-5R Manual v1.0" of the The (Chinese) Radio Documentation Project http://radiodoc.github.io/, but I am having some trouble setting them up the way I imagine they could be, namely, I would like to have the Marine FM channels, at least 1 through 28, correspond to the Channel Mode channels on the Baofeng, followed by those NOAA Weather channels in any order I can get them on board.

When I try copy-and-pasting or importing the Marine VHF Channels from CHIRP's stock config over the Baofeng's original "image" file as shipped (and downloaded and backed up on my computer), CHIRP seems to divide up each of the Marine channels into 9 separate row listings cumulatively numbered in the "Loc." (Locations?) column in what look like .05 frequency increments. Do these "Loc." (Locations?) settings correspond to "channels" in the radio's "Channel Mode", I wonder?

At this point I must concede that I need some knowledgeable assistance. Does anyone have on hand, or can someone create for me, a Baofeng-ready image file that I can just Upload to Radio with the Marine Channels, preferably corresponding to the Baofeng channel mode channels (at least up to channel 28), and then lob the NOAA Weather channels after them any which way they'll fit into the channel lineup? My hunch is that some of you folks would be able to do this faster than I can make toast, and I am frankly now grown weary of all this plodding unsuccessfully up this rather steep learning curve. Look, I'm not hoping one day to chase Saudi satellites to the horizon or contact far-flung repeaters in Malaysia or phone home to my white-robed Neptunian Overloards while I play tag with the FCC. I just want a pair of nice cheapo backup Marine Radios that'll most likely never be reconfigured ever again, so I can maybe tell that oncoming shape in the fog that it's bearing down on my little sailboat. That is all. Your help and mercy would be much appreciated.

Thanx!

There are several companies that can easily do this programming requirement for you. Some of them advertise on Amazon, some on e-Bay. Pick your choice.

Just a minor comment - marine is governed by Part 80 of the FCC rules, and the Baofeng's are not certificated for Part 80. Of course they work just fine there, but technically not legal. Of a more important concern from my point of view is having a reliable radio for marine use, and while the Baofeng is the attractive cost option, you might want to consider having at least one "real" marine radio on board and have the Baofeng as a backup.

When I was at IWCE I noticed that PowerWerx is marking their name inside the Wouxun radios they import to discourage folks from returning e-Bay and Amazon orders to them for repair or replacement. At first I was thinking about just marking the more expensive product, but considering the mentality of some buyers we'll probably do all of them once we have the laser unit.

It might be a good idea. Kinda sick of it to be blunt. You know the tricks people will pull for $1. I had a rash of charging bases claimed to be bad a few months back that came off Amazon and the buyers would show up trying to get a new one from us, claiming it was bought from us.

We stamped the bottom of them on our versions to prevent this.

It seems we have been getting returns on 3800 batteries, mics and small stuff recently too. Might need to mark the whole box contents.

Jeff,

You may want to consider what exactly Amazon does with all their returns.
They certainly don't send them all back to China.

From what we've been hearing, they just put them back in warehouse stock to
go out to another customer who might not be so fussy.

This email has been checked for viruses by Avast antivirus software.

That's correct, Xuan. Hopefully the next customer doesn't mind an LCD that's already going bad, or the flashlight not working, or the FM radio option not working, or the radio's modulation being way low (almost nothing), or the number 6 key on the keypad not working, etc., etc. - all those little "fussy" things we've seen on radios purchased by our customers via the internet (grin).

On the bottom of each email is a link,"Visit your group". Find you way to thefiles section and get the driver I uploaded.I'm running W7x64PRO and it came from a miniCD that came with a fake CAT cable. It's aperfect 3.2.0.0 Vista version. It works my"CAT" and "Kenwood" cables.

Hi Folks,

I'm having trouble with WIndows 7-64bit

I plugged in the BAOFENG cable, and it shows up in the device driver
with no question marks etc.
as ""Prolific USB-to-Serial Comm Port"

Then I check the properties, and notice it's "COM4" -okay
Can Chirp deal with 9600 baud?
Is Flow Control is "None" -- right?

So I assume I'm done with drivers, not real clear.

I got the daily build of CHIRP and installed it next.

Run CHIRP, select Baofeng and model UV-5R (my model is UV-5RA)
Nothing shows up as a selectible Port == even in the dropdown box
I thought I'd be able to select COM4, but CHRIP doesn't see it.

Now what? More drivers needed ?

I noticed the "downloaded drivers" comment in this thread, but what
is the URL used, and what filename was downloaded? It's helpful
top include URL and Filename when mentioning something like
"I got the download and great, it works" -- begs the question <<grin>>
What Download? and from Where?

Thanks

Jeff, W6FCC

49955. Preprogrammed frequencies in UV-5R

Yahoo group: baofeng_uv5r (2015)

From: raitchd@...
Topic: 49955 Message: 49955

I received a newly purchased UV-5R two days ago and was surprised to find that it had 22 channels already programmed in it. Some of the frequencies are at 465.525 MHz, 438.500 MHz, 172.500 MHz and 155.700 MHz . I do not yet recognize the frequencies. I wonder if any one else has received a new, "unused" UV-5R that came preprogrammed or was the memory blank? Are my suspicions that this is actually a used radio correct?

This is common test freq pattern used to check QA from the factory. Those freqs will also have various DCTS and CTCS tones used in the testing.

We had people actually using the test freq patterns here , units bought online and an unlicensed users were operating on those freqs which happened to fall on a Med net and a Forestry channel.

>series of radios.Â There may be other differences as well, but those are
>the 3 that most folks have issues with in my group.

Don't forget better RX audio, the channel select knob on the B5 & faster
scanning. I have both the UV-5R & UV-B5, & end up grabbing the B5 over the
5R most mornings.

True enough, Craig, but to play Devil's Advocate, we have to recognize that probably half the BaoFeng radios that Amazon gets as returns have nothing whatsoever wrong with the radio other than having been bought by people who were too stupid or too lazy to even find this forum to ask how to make the radio work.

From: mailto:baofeng_uv5r@yahoogroups.com

That's correct, Xuan. Hopefully the next customer doesn't mind an LCD that's already going bad, or the flashlight not working, or the FM radio option not working, or the radio's modulation being way low (almost nothing), or the number 6 key on the keypad not working, etc., etc. - all those little "fussy" things we've seen on radios purchased by our customers via the internet (grin).

It's just that the Genuine Baofeng brand cable is a counterfeit, which means problems with the driver. You are really much better off spending a little more money to buy a genuine cable, but yours can be made to work. Without sending you all over the place, here is the direct link to the fix. All true, Xuan, but with Amazon's no questions asked return policy you do have to wonder if some folks aren't using a radio for a while (and once it develops a problem) simply ordering a new one and returning the older one against the new order? Since the Amazon clerks don't know the product and no serial numbers are on the boxes, it would be a very easy swap, plus Amazon even pays for the return shipping.

I had one guy walk out at a swap meet to the parking lot and return in 10-minutes saying the radio stopped working. In the same box and bag we just gave him. My helper handled it and quickly opened the box as we were flooded that day with idiot questions and the standard “Can I talk to Da Police” types. A quick going over between answering questions he accepted it.

When I was unpacking I looked at the marked “bad radio” to see what might be the problem only to discovery the keypad numbers were so worn they were curved. Every single item in the box was broken.

Belt clip, charger, antenna, wall wort. I am sure you’re 100% right this is happening to Amazon too.

Buy a new radio, send your old one back in the same box with all your broken components the very next day. Someone not paying attention then puts the box back in a bin.

The other trick that was used on us happened last summer when the bad stuck mic jacks were an issue in the BFBS 311-313 groups. It seemed, they would show up with a rest radio and tell us they accidently reset theirs. So we would upload another program on the radio to get them operational again.

I did this because the reset test freqs are very close to Med and forest PS freqs here which I did not want them on. However as soon as we did this they would try a radio check and loudly exclaim that the mic doesn’t work anymore. Then demand a new radio. So that service stopped too, it amazes me the tricks and scams people will pull over something as cheap as these radios are.

I won't mention the store but it was one of the big 3 -I picked up a dual band mobile and it worked fine until it sat in the RX mode and after a half hour it would not transmit and I took it back .they called me 2 days later and said it worked fine for them so I took back. Same problem And 3 round trips And the 3rd time they gave me another new rig but they sapped the bottom cover And I assume they sold it off via mail order to some poor ham.On the way home I had a blow-out on the front wheel so all the gas and A new tire Totalled over 600.00.So much for the sale on a new dual band rig,I think they unloaded a lemon on me So you can't trust dealers either Bob AF2Q

A quick going over between answering questions he accepted it.

When I was unpacking I looked at the marked “bad radio” to see what might be the problem only to discovery the keypad numbers were so worn they were curved. Every single item in the box was broken.

Belt clip, charger, antenna, wall wort. I am sure you’re 100% right this is happening to Amazon too.

Buy a new radio, send your old one back in the same box with all your broken components the very next day. Someone not paying attention then puts the box back in a bin.

The other trick that was used on us happened last summer when the bad stuck mic jacks were an issue in the BFBS 311-313 groups. It seemed, they would show up with a rest radio and tell us they accidently reset theirs. So we would upload another program on the radio to get them operational again.

I did this because the reset test freqs are very close to Med and forest PS freqs here which I did not want them on. However as soon as we did this they would try a radio check and loudly exclaim that the mic doesn’t work anymore. Then demand a new radio. So that service stopped too, it amazes me the tricks and scams people will pull over something as

cheap as these radios are.

All true, Xuan, but with Amazon's no questions asked return policy you do have to wonder if some folks aren't using a radio for a while (and once it develops a problem) simply ordering a new one and returning the older one against the new order? Since the Amazon clerks don't know the product and no serial numbers are on the boxes, it would be a very easy swap, plus Amazon even pays for the return shipping.

True enough, Craig, but to play Devil's Advocate, we have to recognize that probably half the BaoFeng radios that Amazon gets as returns have nothing whatsoever wrong with the radio other than having been bought by people who were too stupid or too lazy to even find this forum to ask how to make the radio work.

From: mailto:baofeng_uv5r@yahoogroups.com

That's correct, Xuan. Hopefully the next customer doesn't mind an LCD that's already going bad, or the flashlight not working, or the FM radio option not working, or the radio's modulation being way low (almost nothing), or the number 6 key on the keypad not working, etc., etc. - all those little "fussy" things we've seen on radios purchased by our customers via the internet (grin).

From what we've been hearing, they just put them back in warehouse stock to go out to another customer who might not be so fussy.

Subject: Re: [baofeng_uv5r] FYI on chirp software... I got it working.

It really all depends on where you live and the proximity of repeaters in your area. "If" you only use repeaters very close to you (say 10 miles) and you only have 10-15 repeaters within that area (say Lawrenceville, NJ), then you might very well program the UV-5R manually.

If your local repeaters are much larger in number (42 within 10 miles, 106 within 25 miles for my Mesa, AZ area), or if you do any traveling around within your state (360 open 2m/440 repeaters here in AZ), it really makes sense to use a computer with some version of programming software, plus you can't "name" the repeaters (using the keypad) with a Baofeng radio like you can with a TYT unit, so keeping track of which (of multiple) 146.940 repeaters you are trying to use is much easier with named repeaters.

Yes indeed. There's a brand spanking new Standard Horizon Eclipse DCS GX1000S http://standardhorizon.com/indexVS.cfm?cmd=DisplayProducts&ProdCatID=83&encProdID=F6B95C8EE1B8550C32EA1BC344421959&DivisionID=3&isArchived=1 in the cabin installed by the previous owner of the boat (a nice old Macgregor 26X https://www.youtube.com/watch?v=HDKfX6d4qHk that I just got last week). The two Baofengs are for easy access in the cockpit and maybe for a future dinghy or just as a stowable backup. And yes, I know they're not strictly "kosher" under FCC device approval rules, but I'm OK with that. Mostly they'll only be receiving anyhow.

I also just want to take this opportunity to close out this thread by thanking the gracious listmember who was kind enough to contact me "off-list" with the solution to my programming quandaries, and whose identity I will not divulge. This was obviously a LOT more helpful than that previous suggestion in this thread, which I took, rightly or wrongly, to be just sort of "bitchy" or "snarky", that I just bugger off in the vague general direction of amazon.com or eBay or wherever to search out some random programmer. Not super helpful that.

But anyhow, on balance I am thankful to this group for helping me sort this matter out successfully, and we'll hear you later.

A fair amount of us actually try to follow the rules, and we are not going to help anybody that admits they don't care about breaking the rules. We have suggested to many other people to not be open about it and to maybe start their own group. I think there actually is another group that openly brags about not caring about the rules. You may think we are being 'bitchy' or 'snarky', we don't care. All we are doing is pointing out it is not legal to use the radio the way you want, and you think WE are the bad guys?
BTW, 99.999% of everybody's questions can be answered by simply following the links at the bottom of EACH AND EVERY email sent through this group for the FAQs and the Miklor site.
If everyone started off by looking there, they just might learn something.

Here is a list of things that you can do with a computer, programming cable and software that you cannot do from the keypad...

1. edit channel names
2. set channels to be RX only (TX blocked)
3. set channels to be skipped when scanning
4. set the backlight timeout higher than 10 (11 through 24)(requires CHIRP)
5. enable automatic keypad lock
6. disable broadcast FM mode
7. disable RESET menu
8. disable all menus
9. edit power-on messages
10. edit the VHF and UHF band limits
11. program channels with frequencies outside the band limits
12. edit PTT-ID codes
13. edit ANI code
14. enable ANI code
15. edit DTMF ON and OFF times (speed)
16. edit the VHF and UHF squelch thresholds (make squelch useable)(requires CHIRP)
17. disable the VHF and/or UHF VFOs (requires CHIRP)
18. export the channels to a CSV file so they can be printed (requires CHIRP)
19. import channels from external data sources (RadioReference, RepeaterBook etc)(requires CHIRP)
20. import channels from "stock config" files (requires CHIRP)
21. import channels from other radio models and vendors (requires CHIRP)
22. move and copy channels (requires CHIRP)
23. mass erase blocks of less than 128 channels (requires CHIRP)
24. edit channel parameters (requires CHIRP)
25. edit multiple channels at the same time (requires CHIRP)

Thanks to those who are helpful.

I missed the link at the bottom of this group, that doesn't appear in ANY of the messages I've received since I don't get individual e-mail messages (setting for this group). I guess the guy with the sarcastic commentary must be involved in some way with these radios, or so it seems. So I'll not post any further questions.

However, it's clear that the radio CAN get into a state that requires a total reset, but I haven't tried to replicate how to accomplish that lockup. Having written lots of software in my career, including microcode of the sort that is used in these small devices, I know that one cannot always anticipate what some user may do, or when, to cause a program to do something unexpected.

Again, it's been interesting.

In the past the Uv5RAX was a 220 mhz version. They are harder to find as the supply has switched over to the uv82 220mhz version.

Unless it is a different freq band or a HP (high power) version they are all almost the same and the models are versions made by Baofeng and suppliers at the request of various companies and sellers. Mostly it is all cosmetic case changes.

However, the standard GEN I versions are the + and other UV5Rxxxx nomenclatures. While it is possible that all the latest versions are now fully using the newer chips, it is also a possibility that they are not.

According to Baofeng Tech, Gen I are all the Uv5Rxxx and Gen II are the Bf F8 (reverse display) and HP’s are Gen III’s.

For price differences

Gen I 30-45
Gen II 40-50
Gen III 50 +

Part 90 stickered versions run +$10 over the Gen I prices usually

oddball clones are higher too along with new models until an update or a newer model comes out.

These radios work, and are cheap that is their biggest selling points. However, much better models exist but you get what you paid for.

Hi Bob, haven't seen your callsign for years.

I just got a UV-5RA that had a failure on the audio plug (not making connection after removing the speaker mic or programming cable). I bought another and it was a UV-5RAX+, have you heard of that model? Both from Amazon.

I'm not sure when they released that callsign into the pool, all the 1x3 calls ending in FCC used to be reserved for use as station calls for FCC personnel on duty under direction of the district engineer; but apparently these calls went back into the pool some time in early 1998 when a couple were issued as regular calls. My personal guess is that they were probably put into the pool by accident when they computerized the sequential call system about that time.

ULS shows a few regular amateur W#FCC and K#FCC calls as having been issued and later cancelled. Most have been bought up under the vanity call program since then, but several of the N#FCC calls are still in service as regular (sequential) calls.

Bob,

I noticed you were looking for the IFR A7550 manual on another group. By any chance do you have a PDF version of the operating/user manual? I have the repair manual, but not the user manual.

My Tektronics A2710 no longer receives, although it seems to do everything else (frequency tests pass for example, memory okay, etc.)

I'd like to look over the IFR A7550 user manual to learn more about it.

If you have it, thanks.

my e-mail is my callsign followed by yahoo dot com

Not sure why my W6FCC callsign is a subject of discussion, but here's the facts behind it.

When vanity callsigns were first released for Extra class licensees, several were available, and I listed several on a sheet of paper for a group of us to review. Nobody selected W6FCC, and my application had two other preferences, not including W6FCC.

When I got the W6FCC assignment, I called the FCC asking them why they assigned it to me because it was NOT on my application. What happened was that the list of callsigns (in my handwriting) that we were looking at got left in the envelope I sent to the FCC for a vanity callsign.

The ones I wrote on the application were already taken by the time they got to my app, so someone at the FCC found the sheet of paper with other callsigns and thought they were doing me a favor by assigning me one from that list, and it was W6FCC (apparently nobody else wanted it either).

When I asked if I could get back my WA4EGT callsign, they said "Well, you can if you apply for it as a vanity callsign" - I was the original assignee of WA4EGT from many years ago, but didn't want to apply for it as a vanity callsign and they would not reverse their assignment.

So I just kept the W6FCC callsign instead of going through another application.

My WA4EGT callsign was used on the SOARA repeaters (2M and 220Mhz) while I was trustee for a few years before the vanity program, but now they have a club callsign K6SOA.

That's how I got W6FCC. As to the idea that W#FCC callsigns were a mistake, I doubt it, they were just available in the pool. Nobody at the FCC really cares about the FCC part of the callsign, and for me, it's just easy to remember as was EGT (Exhaust Gas Temperature -- an important instrument reading on an aircraft). My local contact in the FCC didn't have a special callsign, he wouldn't have wanted people to know he worked for the FCC anyway, so doubtful he'd accept such an assignment anyway.

I believe it was Jim who commented on it originally - it isn't quite as ear catching as the K9DOG sequential call held by Charles Saulka in Illinois, but it does tend to catch the eye in print.

> As to the idea that W#FCC callsigns were a mistake,
> I doubt it, they were just available in the pool.

Well it was either an accident or a deliberate decision. Given that these calls first entered the regular pool at the same time the FCC computerized the sequential license assignments, I tend to suspect that it was an oversight rather than a deliberate decision -- but, of course, we'll never know unless we hear from someone who was in a position to be involved. What I do know is that the FCC contracted out development of the computer software that was used to automate the sequential call assignment system. Prior to computerization there were quite a few three letter combinations that were routinely skipped, including q-signals, many 3-letter words, and some other combinations. Back in the days when assigning or skipping over the next combination on the list was done by hand, the decisions were not always consistent. When the sequential call sign process was computerized, certain letter combinations were deliberately kept out of the system. For example, common q-signals.

I also notice that most of the W#FCC and K#FCC calls that were issued as regular callsigns show in ULS as having been cancelled.

> Nobody at the FCC really cares about the FCC part of the callsign,

Clearly that is the case now - but there was a time when ham and other callsigns with the letters FCC in the call were not issued to anyone but were reserved for use by FCC personnel in those unusual instances where they got on the air on FCC business. The one instance that I personally know of was when an enforcement team was in my local area in the 1970's where they used KFCC#### several times on CB. I know it wasn't just someone spoofing because the team also visited and spoke to meetings of some CB clubs in the area.

It may have been atmospheric or an issue on the repeater side. For comparison, I purchased a more robust Icom IC-T70A and worked the local repeater with both radios. The Icom receive is slightly more sensitive and audio much clearer. What a difference $150 more makes.

Thanks

KB1GZN

I like that one too.

I have kept mine. I had a Novice license in the 60’s as a kid. Let it expire and many moons later got my current call sign.

I never went for a vanity sign but..maybe dropping a K would be easier.

My call sign has my initials in it

KK6CRP

maybe K6CRP easier for Field Day.

K6BAD ? has a good ring

50011. cable problem?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-10 19:31:23 UTC
From: Ed Cifelli
Topic: 50011 Message: 50011

Actualy this is word of advice. A friend had asked me to program his BF8 with some legal simplex frequencies, which I did. I kept the d/l info one my computer as I do with the other radios that I have. Yesterday he advised that one of his kids found where he had the radio and started pushing buttons and the the radio was talking Chinese. OK Complete reset. Since I had all the data, I grabbed the cable, found the data in Chirp and proceeded to reload radio. I wouldn't talk to computer. Grabbed another radio and it talked fine. So cable is ok. Tried his radio again, no joy. Started to do a manual program which frustrated me. Put cable back in and pushed hard, no joy. Then I pushed harder and Bingo. So sometimes it the cable is not reading radio you may have to push real hard to get it to seat properly.

Hello,

I just wanted any suggestions for a good book to use for teaching the TECH class license.

If anyone is an instructor or recently licensed and has a recommendations for a study book please contact me off list.

My two choices now are:

Gordon West
ARRL

The target age is going to be 45++ crowd with a majority of them being at the magical age where they did not grow up with high tech or computers so they will not be all 100% computer or tech savvy.

50013. Re: [baofeng_uv5r] cable problem?

I have noticed some of the new versions coming out have the mic jacks setting slightly lower nearer the radio body edge. What worked before now requires caution and close inspection to insure the cable housing is not obstructed preventing the cable to fully seat into the radio.

I ended up grinding a small amount of the cable housing jack material on one of our programming cables to use for these slightly off center radios coming out. They are just slightly off enough to not allow a full seat.

I programmed 25 yesterday with 2 having this problem.

I was wondering what "legal simplex frequencies" he might be referring to. The radio is only valid for Part 90 and Part 97, both of which require licenses.

MURS and FRS (the most likely "legal simplex frequencies") are both Part 95, which the radio is not certificated for.

"not certificated for" - perhaps you meant not certified for, or perhaps you are referring to a Bushism (sometimes referred to as Bushspeak). In any case, quite humorous, or in the case of Bushspeak, quiet humorous (grin).

The word "certificated" is correct It appears in the FCC part 90 rules
13 times and 36 times in the part 95 rules. Here is an example:

§ 95.129 Station equipment.
Every station in a GMRS system must use transmitters the FCC has
certificated for use in the GMRS. Write to any FCC Field Office to
find out if a particular transmitter has been certificated for the
GMRS. All station equipment in a GMRS system must comply with the
technical rules in part 95.

The frequencies are legal. The equipment might not be, or the user might
not be, or the circumstances might not be.

My use of both 6205 kHz and 92.4 MHz is legal with some equipment but
not others.

My Amateur license has nothing to do with the legality of my transmitting on 151.865MHz simplex. My employment at the University of Tennessee at Martin IT Department is what grants me use of that frequency on campus.

From: oldbuoy
Topic: 49942 Message: 50027

Thanks for the info. Like I pointed out in a subsequent posting, the boat comes with a proper Marine Radio installed in the cabin and a decent antenna, both brand new. The two Baofengs will pretty much just be one for easy monitoring in the cockpit and possible future dingy use, with the other stowed as a backup. At just $22 bucks each shipped, if they last a season or three I'll be happy enough.

On May 10, 2015 7:27 AM, "Nicholas Papadonis npapadonis@yahoo.com [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:
>
>
>
> FYI these radios are not legally approved by the FCC to operate on Marine VHF frequencies. You must purchase a legally approved Marine VHF radio for that. Also, as a boat operator, I would not recommend the Baofeng for use in wet humid environments and especially those with corrosive salt water. The Baofeng lacks any water proof rating and suspect it’s electronics may oxidize.

>>
>>
>>
>> I recently got two nice Baofeng UV-5RA+ units in yellow and blue running what I think may be BFS297 firmware. My needs right now are pretty simple: I hope to set them both up as backup Marine VHF transceivers with the 7 NOAA Weather Channels (preferably as "receive only") as well.
>>
>> I managed to get the correct Prolific drivers (2.1.51.238) correctly installed on my ancient Alienware m9700 laptop that's still rockin' Windows XP Pro thanks to Miklor.com's excellent guide, and also the latest daily build of CHIRP as of a few weeks ago (ver. 20150416).
>>
>> I am not sure if I correctly followed all of the tips I've found on this forum and in the great little "Baofeng UV-5R Manual v1.0" of the The (Chinese) Radio Documentation Project, but I am having some trouble setting them up the way I imagine they could be, namely, I would like to have the Marine FM channels, at least 1 through 28, correspond to the Channel Mode channels on the Baofeng, followed by those NOAA Weather channels in any order I can get them on board.
>>
>> When I try copy-and-pasting or importing the Marine VHF Channels from CHIRP's stock config over the Baofeng's original "image" file as shipped (and downloaded and backed up on my computer), CHIRP seems to divide up each of the Marine channels into 9 separate row

listings cumulatively numbered in the "Loc." (Locations?) column in what look like .05 frequency increments. Do these "Loc." (Locations?) settings correspond to "channels" in the radio's "Channel Mode", I wonder?
>>
>> At this point I must concede that I need some knowledgeable assistance. Does anyone have on hand, or can someone create for me, a Baofeng-ready image file that I can just Upload to Radio with the Marine Channels, preferably corresponding to the Baofeng channel mode channels (at least up to channel 28), and then lob the NOAA Weather channels after them any which way they'll fit into the channel lineup? My hunch is that some of you folks would be able to do this faster than I can make toast, and I am frankly now grown weary of all this plodding unsuccessfully up this rather steep learning curve. Look, I'm not hoping one day to chase Saudi satellites to the horizon or contact far-flung repeaters in Malaysia or phone home to my white-robed Neptunian Overloards while I play tag with the FCC. I just want a pair of nice cheapo backup Marine Radios that'll most likely never be reconfigured ever again, so I can maybe tell that oncoming shape in the fog that it's bearing down on my little sailboat. That is all. Your help and mercy would be much appreciated.

50029. UV5R battery charging

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-11 13:47:41 UTC
From: stanwhite_snr@...
Topic: 50029 Message: 50029

Hi,

Just got an extended battery for the UV5R. It didn't fit, but now it does :-) But the charging is odd, and then I did some research.

Here is what I found from experimentation:

Using the standard charging cradle, and the standard 1800mA/Hr battery, charge terminated at 8.4 volts.

Using the same cradle, with the 3800 battery, charging terminated at 8.5 volts.

This was repeatable. I started to figure why, and learned a few things. It appears that when a lithium battery is "full", the current starts to ease off, and the charger detects this and shuts down. It is the drop in current, combined with the voltage, that causes the "end of charge" condition.

The standard battery, at 400 Ma charge, is being charged at around 0.22C, (just over a fifth of its capacity).

The 3800 battery is being charged at 0.1C (A tenth)

Then I found that if a lithium battery is charged below about 0.18C something interesting happens. The following information was taken from the Powerstream site: How to charge Lithium ion Batteries, lithium polymer batteries, and lithium iron phosphate cells. http://www.powerstream.com/li.htm

http://www.powerstream.com/li.htm

How to charge Lithium ion Batteries, lithium polymer ba...
http://www.powerstream.com/li.htm Charging methods for lithium batteries including slow charge, fast charge and smart charge techniques.

View on www.powerstream.com http://www.powerstream.com/li.htm
Preview by Yahoo

"When the charge rate during the constant current phase is low, the charger process will spend less time during the constant voltage tail. If you charge below about 0.18 C, the cell is virtually full when the 4.2 volts is reached. This can be used as an alternative charge algorithm. Just charge below 0.18C constant current and terminate the charge when the voltage reaches 4.2 volts per cell."

And:

"The charge cannot be terminated on a voltage. The capacity reached at 4.2 Volts per cell is only 40 to 70% of full capacity unless charged very slowly. For this reason you need to continue to charge until the current drops, and to terminate on the low current."

So I am guessing that maybe the 1800 battery gets charged, the current drops, and it gets a "topping off" charge, but due to the low charge rate of the cradle (low, compared to the bigger battery), that this battery is not fully charged at 4.2V per cell, and the charge continues until a safety mechanism in the charger takes over. (Or a safety device in the battery?)

I have just ordered a charger that is not going to be here for a while. but it is 8.4V, at 2A, which is about right for a 3800 battery. I will be making measurements with interest, but until then, maybe you may like to check out your situation with the bigger battery, and if you find it terminated at 8.5 volts, then immediately get the radio on to to take some out? I did....

Be interested to see your findings,

73 de Stan, G4EGH

What I did was use the trimmer inside to reduce the charge to 8.3V. That gives you about >90% of the rated capacity and helps extend the life of the battery.

Legally your employment has nothing to do with it. The only two factors involved are
1) Specific permission from UNIVERSITY OF TN AT MARTIN for you to operate under that license
and
2) Compliance with the conditions of that license (which include compliance with Part 90 of the FCC regulations)

With the permission of the University, you can use 151.865 MHz on campus and anywhere within Martin TN (but nowhere else) - the same would be true if you were a student or simply any person that the University authorized to operate under the license. Your employment is likely to be the reason that the University chooses to authorize you to operate under their license (assuming that they do authorize your operation), but your employment itself does not give you that authorization.

If someone has created a file with local repeaters it would save time. Also you can review the entries and if they aren't useful to you don't use them.

Hi Mike,

Didn't see a trimmer in mine.. :-(

I did get the schematic for the charger, and it appears to use a chip that is fixed voltage. The current is easily changed though.

I did hear that the TYT charger was different.

I do like to keep my lithiums around half charged, so far 5 years, and about 50% of my laptop battery left.

<chuckle> Thanks for the technical clarification necessitated by my careless statement.
But when the folks up front hand you the FCC paperwork to keep track of, you just figure
it's part of the job and it includes their "specific permission" and authorization to
operate under the terms of the license.

Absolutely. In fact, in your case, it would appear that you are the individual who would be responsible for giving that "specific permission" on behalf of the University.

The reason I brought up the distinction is because far too many people assume that because they work for or with some company, agency, or organization that has a Part 90 license that they are somehow magically imbued with the authorization to get their own radio and use it on the company frequencies.

The UTM license is a good example of why that assumption can't be true. UTM has a license for one fixed base station which must be transmitting from Room 110 of the UTM Administration Building, and for 8 mobiles which can transmit from anywhere on campus or within Martin TN. If everyone who worked for the University decided to get a radio to use on 151.865MHz, there would quickly be more than 8 mobile stations claiming to operate under that license - which could cost the University up to $10,000 per day per extra station if they weren't taking adequate steps to prevent the unauthorized use.

Currently experimenting with a 470uF cap across the charger output, charger neg to battery neg, and charger Positive to battery positive via a 1N5819 (1 amp Schottky diode).

Been continuously monitoring the battery voltage, and so far, it is at 8V, charger O/P at 8.5V, and the red charging lamp is on.

I won't be going to bed leaving it on....! :-)

I believe that repeaterbook.com (and possibly others) have the ability to download a proximity repeater file (say 25 miles around San Diego, for example) and that file can be imported into Chirp or RT Systems with very little effort.

Bob,

The dumbing down of America has allowed folks that otherwise would never have been able to pass a test 20-30 years ago to now have a license. With that comes good (more folks in the hobby) and the bad (more lids in the hobby). Not that anyone can totally escape it, but you'll generally find most of that is on 2m repeaters (and yes I'm aware that it also exists on the hf bands), but as you get more into niche modes (like 2m SSB or various digital modes on hf) that virtually disappears. My wife is an Extra as well and rarely goes on 2m FM, but does enjoy 2m SSB and 70cm (both FM and SSB), so intelligent conversation is out there, but I agree that sometimes you have to look for it a little bit harder nowadays.

I can guess the reason you might have better convo’s on SSB is related to the fact you cannot find a Baofeng for $30 that does SSB. This limits the pool of potential users. They would need to spend more than $30 and understand SSB operation. This leaves more serious Ham’s to use that mode. I wonder how many Goof’s are on 160M? Maybe not too many as the antenna and equipment required is also not in the $30 price range and HT’s do not come in 160M from Amazon .

I think digital modes has the same thing as the radios are more pricey and running something like PSK31 requires more effort than pushing the PTT.

I guess these are the bands and modes the tinkering Hams are migrating too. I never hear too many YL Hams on the 70/2m repeaters here because they get run off by the basement creep crowds.

Tonight on my favorite comic relief repeater I was listening to someone telling another person that they are on their way to their house to beat them with a baseball bat.

You got to love those Friday night arguments when it is payday and beer night.

Bob,

The dumbing down of America has allowed folks that otherwise would never have been able to pass a test 20-30 years ago to now have a license. With that comes good (more folks in the hobby) and the bad (more lids in the hobby). Not that anyone can totally escape it, but you'll generally find most of that is on 2m repeaters (and yes I'm aware that it also exists on the hf bands), but as you get more into niche modes (like 2m SSB or various digital modes on hf) that virtually disappears. My wife is an Extra as well and rarely goes on 2m FM, but does enjoy 2m SSB and 70cm (both FM and SSB), so intelligent conversation is out there, but I agree that sometimes you have to look for it a little bit harder nowadays.

In general, Rich, I think most new folks to the hobby (hams included) are so bewildered by tiny little FM handhelds (pick your brand) that they rarely venture beyond their local repeaters, or if they do, it takes them years to discover ham radio is much more than just an HT on 2m or 70cm working a repeater down the block.

I can't tell you how many times I've had new hams ask me for the correct offset and/or PL tone for 146.52 simplex, or folks will argue with me that their large metro area (say Chicago) only has a small number of repeaters (forgetting the fact that repeaterbook and the ARRL both show many more - of course some probably are just paper repeaters). Their entire concept of radio is either use a local repeater that they can work with their duckie or go right to hf with "huge towers and antennas" - nothing in between.

They look at me with disbelief that entire conversations and nets happen on simplex, and it seems crazy (to them) that folks can communicate many miles on 2m simplex (or would even try talking on simplex), and even further on 2m SSB.

Of course if we do move during the next year or two, I certainly plan on growing a large antenna garden again, as I miss my old KLM KT-34XA tri-band beam up on a Rohn 45 tower. I'd love a newer Rohn 55 foldover, but with everything else I'll want I'm not sure that baby will be in the hobby budget. I'm considering building a 5 band (10-12-15-17-20m) quad antenna (I built a simple 4 element 10m quad years ago that worked great), but if we move up north I'm worried that snow and ice would constantly be an issue with a large quad multi-band antenna. At least my wife (being an Extra) won't be the one giving me any grief over my CCR demands, but I'll bet the real estate agent will go nuts.

50053. RE: [baofeng_uv5r] UV5R battery charging

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-12 12:05:41 UTC
From: stanwhite_snr@...
Topic: 50029 Message: 50053

And that did not work too well....Measured 40mA going into the battery all the time, and did not wait for the voltage to approach maximum.

Took a look at the internals of the TYT charger, and it seems a simple setup that uses an LM317 for voltage regulation. At 14 volts input, 8.4 volts output, and a charge rate of 400mA, that regulator will be dissipating 2 1/4 watts, and it does not have a heatsink.

I already modified a Baofeng base to have a "buck" regulator in it, and it now happily charges a battery without heat problems with an input from 11-24 volts, giving 10v to the charger circuit. I built this in the base. Cost? 1 GBP, or around $1.50

Next base mod will be a comparator driving a relay such that when the voltage gets to where I want it, (probably 8 volts) the relay lets go, and the charge stops. Since the comparator will be looking at the output of the charger, and the relay will merely connect the battery to the charger, when it gets to 8V, charge stops, and the base then feeds 8.4 volts to the comparator, ensuring it locks off. And if my circuit fails? Well, it was only ever going to get the charge that an unmodified charger was going to give.

Yep... I know, lot of hassle for a cheap radio and cheap batteries.....But all part of the hobby, and I'll post any successful schematics I design. Why a relay? Simple, no argument, on or off, and they can be obtained very small...

Without knowledge of any printed University Policy and in the interests of CYA I wouldn't go that far. I believe the UTM Department of Public Safety is ultimately responsible for insuring FCC compliance on campus. A while back the Deputy Chief asked for a copy of the Telephone Department's license and I showed him the FCC ULS search function by FRN so he could get a file copy of all licenses on campus, so I will say I'd probably be consulted if the situation arose where additional units needed to be on the frequency.

And I was trying to clarify that "legal simplex" operation isn't confined to Amateur Radio, and a part 97 license doesn't give that holder privileges on Part 90 frequencies.

> The UTM license is a good example of why that assumption can't be true. UTM
> has a license for one fixed base station which must be transmitting from

Telephone's Midland 70-325 wasn't capable of narrowbanding and has been removed from service.

> and for 8 mobiles which can
> transmit from anywhere on campus or within Martin TN.

Telephone's two Motorola Radius P100 units weren't capable of narrowbanding and have been removed from service.

> If everyone who
> worked for the University decided to get a radio to use on 151.865MHz, there
> would quickly be more than 8 mobile stations claiming to operate under that

> use.

While I understand your purpose is providing educational food for thought and warning to the readers, the reality is that the majority of UTM employees prefer their cell phone for two-way business communication and have no desire to carry a radio. Evidence of that is post-narrowbanding, the IT Department's WNMR760 is a paper repeater, the Gen X much less the Gen Y techs just don't seem to see the utility of LMR. So abuse of 151.865MHz is highly unlikely in our case. Good thing, WQSG800 sometimes walked on us during planting season.

At worst you could probably replace the guts of your charger with the guts of the TYT.

I don't know if TYT makes a charger for whatever model you have...I couldn't find a reference on the radio model you quoted.

Subject: RE: [baofeng_uv5r] UV5R battery charging

I do believe the +'s show as not initially compatible with the high cap battery but is compatible with the stock one so the TYT charger should work.

http://www.miklor.com/uv5r/pdf/UV5R_Acc_Guide.pdf

Then there's this for the UV-5R+ to make the high cap fit…

At worst you could probably replace the guts of your charger with the guts of the TYT.

I don't know if TYT makes a charger for whatever model you have...I couldn't find a reference on the radio model you quoted.

Subject: RE: [baofeng_uv5r] UV5R battery charging

And that did not work too well....Measured 40mA going into the battery all the time, and did not wait for the voltage to approach maximum.

Took a look at the internals of t he TYT charger, and it seems a simple setup that uses an LM317 for voltage regulation. At 14 volts input, 8.4 volts output, and a charge rate of 400mA, that regulator will be dissipating 2 1/4 watts, and it does not have a heatsink.

I already modified a Baofeng base to have a "buck" regulator in it, and it now happily charges a battery without heat problems with an input from 11-24 volts, giving 10v to the charger circuit. I built this in the base. Cost? 1 GBP, or around $1.50

Next base mod will be a comparator driving a relay such that when the voltage gets to where I want it, (probably 8 volts) the relay lets go, and the charge stops. Since the comparator will be looking at the output of the charger, and the relay will merely connect the battery to the charger, when it get s to 8V, charge stops, and the base then feeds 8.4 volts to the comparator, ensuring it locks off. And if my circuit fails? Well, it was only ever going to get the charge that an unmodified charger was going to give.

Yep... I know, lot of hassle for a cheap radio and cheap batteries.....But all part of the hobby, and I'll post any successful schematics I design. Why a relay? Simple, no argument,

on or off, and they can be obtained very small...

As a noob myself I can tell you that the 2M/440 being the entry point is simply the Baofeng UV5R. I have seen them on Amazon for years and wondered. Being a Telecommunications Systems Engineer I did the research and bought one to try. Installed Chirp and lacking any kind of Elmers even in the local clubs I joined (just old men on the "other" bands/modes), did my research. Studied (didn't have to as we have HamCrams here but I wanted to) the Gordon West book and subscribed to HamTestOnline and got my Tech. Actually got a 2 for 1 deal and was offered a General HamCram (no learning just memorization for the General) and got my General at the same time, but don't really have a need for it. Should my interests take me there, I already have it.

Did many hours more research as to how repeaters work and where they are locally and talked my wife into getting her Tech and got her a radio too I mostly talk with her when we commute and do public service, RACES. ARES gigs. Not a repeater chatter myself. I've always been of the mind that if I have nothing to say, I say nothing...

So the single point of origin is a $30 radio. I never would have committed to $150 or more for something I had no real knowledge of and no one to guide me Now my aspiration is a Yaesu VX8GR (w/APRS) and then other modes/bands as $ allows. Natural progression.

Had I been someone with no interest in actually learning the craft and compliance, my entry point still would have been a $30 radio. So blame it on Baofeng... :-)

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote :

In general, Rich, I think most new folks to the hobby (hams included) are so bewildered by tiny little FM handhelds (pick your brand) that they rarely venture beyond their local repeaters, or if they do, it takes them years to discover ham radio is much more than just an HT on 2m or 70cm working a repeater down the block.

I can't tell you how many times I've had new hams ask me for the correct offset and/or PL tone for 146.52 simplex, or folks will argue with me that their large metro area (say Chicago) only has a small number of repeaters (forgetting the fact that repeaterbook and the ARRL both show many more - of course some probably are just paper repeaters). Their entire concept of radio is either use a local repeater that they can work with their duckie or go right to hf with "huge towers and antennas" - nothing in between.

They look at me with disbelief that entire conversations and nets happen on simplex, and it seems crazy (to them) that folks can communicate many miles on 2m simplex (or would even try talking on simplex), and even further on 2m SSB.

Of course if we do move during the next year or two, I certainly plan on growing a large antenna garden again, as I miss my old KLM KT-34XA tri-band beam up on a Rohn 45 tower. I'd love a newer Rohn 55 foldover, but with everything else I'll want I'm not sure that baby will be in the hobby budget. I'm considering building a 5 band (10-12-15-17-20m) quad antenna (I built a simple 4 element 10m quad years ago that worked great), but if we move up north I'm worried that snow and ice would constantly be an issue with a large quad multi-band antenna. At least my wife (being an Extra) won't be the one giving me any grief

over my CCR demands, but I'll bet the real estate agent will go nuts.

On Mon, May 11, 2015 at 11:24 PM, 'R Pryor MAEd CETsr' doopsnoop@... mailto:doopsnoop@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com mailto:baofeng_uv5r@yahoogroups.com> wrote:

I can guess the reason you might have better convo’s on SSB is related to the fact you cannot find a Baofeng for $30 that does SSB. This limits the pool of potential users. They would need to spend more than $30 and understand SSB operation. This leaves more serious Ham’s to use that mode. I wonder how many Goof’s are on 160M? Maybe not too many as the antenna and equipment required is also not in the $30 price range and HT’s do not come in 160M from Amazon .

I think digital modes has the same thing as the radios are more pricey and running something like PSK31 requires more effort than pushing the PTT.

I guess these are the bands and modes the tinkering Hams are migrating too. I never hear too many YL Hams on the 70/2m repeaters here because they get run off by the basement creep crowds.

Tonight on my favorite comic relief repeater I was listening to someone telling another person that they are on their way to their house to beat them with a baseball bat.

You got to love those Friday night arguments when it is payday and beer night.

Bob,

The dumbing down of America has allowed folks that otherwise would never have been able to pass a test 20-30 years ago to now have a license. With that comes good (more folks in the hobby) and the bad (more lids in the hobby). Not that anyone can totally escape it, but you'll generally find most of that is on 2m repeaters (and yes I'm aware that it also exists on the hf bands), but as you get more into niche modes (like 2m SSB or various digital modes on hf) that virtually disappears. My wife is an Extra as well and rarely goes on 2m FM, but does enjoy 2m SSB and 70cm (both FM and SSB), so intelligent conversation is out there, but I agree that sometimes you have to look for it a little bit harder nowadays.

As to APRS, yes. I do a lot of volunteering on events like runs and bicycle races as SAG Wagon. They coordinate using APRS. I have APRSDroid which is good as long as you are in cell range but some of these are in low mountain areas where there are cell blackout areas. The Digipeaters cover these areas, so radio based APRS is preferable.

As to the brand/model, mostly familiarity and there are a couple others who I do this with who have the VX8DR which is similar but WAY more expensive APRS ready. They are similar enough to get help from them as radio based APRS is new to me. Otherwise the features are almost exactly what I would like to have. The only thing missing is cross band repeater capability. Not a big deal though.

I can find these for about $320 - $350 like new but batteries are made of gold! That's about $100 less than the Kenwood, but the UV is discontinued, so I have to consider that too.

Any device that does not have a true on/off SWITCH (a rotary knob that goes click is a true switch) will drain a little battery when "off." If you have to press/hold something to turn it on, then it is not a true on/off switch but a button monitored by the always alive CPU and a small part of memory thus draining a limited amount of battery..

Biggest issue I have with the Yeasu, and this may have changed, is that you can't directly access an internal TNC. With my D72 I can hook up a tablet, netbook or laptop to the radio's mini-USB port and run a mapping program like UI-View for APRS, or RMS Express for Winlink packet. Not sure if the Yeasu can act as a digipeater either. I got lucky and bought mine as a factory refurb with full warranty for <$400.

Just my two pennies, and apologies to the OF yelling for us to get off his lawn. :-)

I have 2 of each. Cost is part of it, weight and features come into play also. The Yaesus are lighter and work well for tracking, but cannot be used as a full tnc setup for packet, etc. the Kenwoods are heavier and may have better gps sensitivity. One cable and a gain mobile antenna, and you have a nice setup for ARES/Races comms. The Kenwoods can also be used as a digipeater. The older Kenwood D7 (I have 2 of these also) is cumbersome to use as a tracker with an external gps, but can be used for packet without digipeating.

Plusses and minuses on each.

From: Roger Elmore
Topic: 49919 Message: 50077

I was playing with 1N34A diode radios when I was 7 years old, but code kept me from Ham Radio. I figure it's like music, some got the talent but I can't play an instrument or carry a tune. Amateur-wise, I'm more interested in digital modes, the University offered a DB224E at 250' on their 300' tower, I've got a Winlink Packet Gateway and an APRS digi/igate on that, the two GE MVS radios combined using the duplexer orphaned when the IT department abandoned their LMR repeater post-narrowbanding.

I bought my Baofengs for LMR, one for a scanner (not that many freqs of interest, so being slow didn't matter) and two for portable use. The only Amateur freqs in those two are for my "field expedient" 440 repeater on one of the itinerant voice pairs SERA assigned for special events and Emcom. Not that I have an immediate need for the UV5Rs, but for $30 they were too cheap to pass on as a project to keep myself occupied for a couple of months while the bank account built back up.

Sounds like you paid quite a bit to work the ISS. Wish I was rich and famous rather than good looking. ;-)

 BOB AF2Q wrote:
I paid $450.00 for mine with the extras but not being a computer person,I just manually put in a couple repeaters and I also worked the ISS twice with the arrow beam. Some people like yoi and others here I envy. Just like CW comes to me so easy but I all lost With programming the new HT's. Reason I still have my old RS 2 and 440 Ht"s but I got used to the China HT's. Cheap and do as good as those $300.00 HT's.

Roger Elmore wrote:
Biggest issue I have with the Yeasu, and this may have changed, is that you can't directly access an internal TNC. With my D72 I can hook up a tablet, netbook or laptop to the radio's mini-USB port and run a mapping program like UI-View for APRS, or RMS Express for Winlink packet. Not sure if the Yeasu can act as a digipeater either. I got lucky and bought mine as a factory refurb with full warranty for <$400.

Just my two pennies, and apologies to the OF yelling for us to get off his lawn. :-)

*****
 Cprendon wrote:
As to APRS, yes. I do a lot of volunteering on events like runs and bicycle races as SAG Wagon. They coordinate using APRS. I have APRSDroid which is good as long as you are in cell range but some of these are in low mountain areas where there are cell blackout areas. The Digipeaters cover these areas, so radio based APRS is preferable.

As to the brand/model, mostly familiarity and there are a couple others who I do this with who have the VX8DR which is similar but WAY more expensive APRS ready. They are similar enough to get help from them as radio based APRS is new to me. Otherwise the features are

almost exactly what I would like to have. The only thing missing is cross band repeater capability. Not a big deal though.

I can find these for about $320 - $350 like new but batteries are made of gold! That's about $100 less than the Kenwood, but the UV is discontinued, so I have to consider that too.

I have had uv5r plugged in all the time, radio in it, on Charge for the last year. 80percent of the time it is on charge, 18 percent of the time off charger monitoring, and 2 percent of the time talking.

Battery is still like new. Radio never hots. Charger base never gets hot.

Why all the worry?

At worst you could probably replace the guts of your charger with the guts of the TYT.

I don't know if TYT makes a charger for whatever model you have...I couldn't find a reference on the radio model you quoted.

Subject: RE: [baofeng_uv5r] UV5R battery charging

And that did not work too well....Measured 40mA going into the battery all the time, and did not wait for the voltage to approach maximum.

Took a look at the internals of t he TYT charger, and it seems a simple setup that uses an LM317 for voltage regulation. At 14 volts input, 8.4 volts output, and a charge rate of 400mA, that regulator will be dissipating 2 1/4 watts, and it does not have a heatsink.

I already modified a Baofeng base to have a "buck" regulator in it, and it now happily charges a battery without heat problems with an input from 11-24 volts, giving 10v to the charger circuit. I built this in the base. Cost? 1 GBP, or around $1.50

Next base mod will be a comparator driving a relay such that when the voltage gets to where I want it, (probably 8 volts) the relay lets go, and the charge stops. Since the comparator will be looking at the output of the charger, and the relay will merely connect the battery to the charger, when it get s to 8V, charge stops, and the base then feeds 8.4 volts to the comparator, ensuring it locks off. And if my circuit fails? Well, it was only ever going to get the charge that an unmodified charger was going to give.

Yep... I know, lot of hassle for a cheap radio and cheap batteries.....But all part of the hobby, and I'll post any successful schematics I design. Why a relay? Simple, no argument, on or off, and they can be obtained very small...

From: cprendon@...
Topic: 50080 Message: 50080

I am running Chirp daily-20150312 on Win 7 64 bit and programming BFF8+Ver BFS313 and I just discovered that the Menu 34 TDR-AB does not write or read to/from Chirp. No matter what is in the radio when I download or in the image when I upload it is not reflected When the radio = A and I do a download the image says off or when I write to the radio where radio = A and when I upload an image where Dual Watch TX Priority = off the radio still is A. So Chirp neither reads DW TX Pri or writes it to the radio whether the radio or image has DW enabled or not. Tried it both ways just in case.

Is this a known bug or user brain fart? Or do I need to get the latest daily build and try again? I know this was not a problem in the 20150111 build before I upgraded to the above version.

I just hate to install or uninstall software in Windows unless necessary. Every now and then something "unexpected" happens.

I like the Baofeng radio line as much as most, but let's remember that the big 3 (and various other Chinese suppliers as well) get the additional money they are asking for primarily because their radios and/or accessories either: a) work better, and/or b) have additional features that many are willing to pay for.

Baofeng radios (regardless of the model you like) all have various quirks, but for the price (and for some that's the single overriding factor) most of us just live with those quirks.

I had one of these turned into me that had issues and ended up using the Chirp recovery version plus the factory reset image. I then used the reset image to create the program I needed and uploaded to clear it.

It happened when someone used Chirp to change the existing program causing this problem. Not sure what build they used.

They complained that menu tabs in Chirp would disappear too in the main Gui another issue I saw on their computer- bot sure if they had a bad install or antivirus programs are an issue. Updating the build worked then the problem returned.

I stopped doing computer support for this stuff as people were bringing me laptops with viruses and outdated software and other issues complaining it was Chirp that caused it. Since I advised them to use Chirp I helped out with driver issues and computer updating to get them going.

Now I tell them if chirp does not work to buy RT systems, which many do not want to spend $49 for it.

From: Xaun Loc
Topic: 49919 Message: 50084

That's true. But the better modern circuits use barely more power than what the battery loses internally anyway - batteries don't maintain a charge forever even when completely disconnected.

On the other hand, devices that use battery power to run a clock and other junk while "off" do tend to eat batteries.

From: mailto:baofeng_uv5r@yahoogroups.com
Any device that does not have a true on/off SWITCH (a rotary knob that goes click is a true switch) will drain a little battery when "off." If you have to press/hold something to turn it on, then it is not a true on/off switch but a button monitored by the always alive CPU and a small part of memory thus draining a limited amount of battery..

This email has been checked for viruses by Avast antivirus software.

The problem is that Baofeng has basically ruined TDR-AB. There are at least three ways it works now. CHIRP supports the original way where you have 3 choices (OFF, A and B) and chosing A or B forces priority to the selected display.

On the most recent radios, the TDR-AB setting is no longer relevant. You can change the menu setting, but it means nothing because the setting will track the display selected by using the [A/B] key.

Try it. Set menu 34 to "B". Exit and then select the top display with the [A/B] key. Now go back into menu 34. Menu 34 will be set to "A".

And on some firmware versions OFF was removed (it sound like this is what you have) so A was shifted to the memory location that used to be OFF and B was shifted to the memory location that used to be A. That make CHIRP's OFF and A equal to the radios A and B.

So if you have an older radio where TDR-AB sill forces priority, CHIRP works as expected. But if your have one of the new radios where Baofeng changed the behavior or menu 34, then CHIRP won't work. It doesn't matter because setting it from menu 34 won't do anything useful either.

Yes a complaint about the off being shown in Chirp and not avail on the radio.

Any ideas why the menu items would disappear? Such as the whole tab for settings not appearing in the main gui.

Subject: Re: [baofeng_uv5r] Chirp or User Bug?

The problem is that Baofeng has basically ruined TDR-AB. There are at least three ways it works now. CHIRP supports the original way where you have 3 choices (OFF, A and B) and chosing A or B forces priority to the selected display.

On the most recent radios, the TDR-AB setting is no longer relevant. You can change the menu setting, but it means nothing because the setting will track the display selected by using the [A/B] key.

Try it. Set menu 34 to "B". Exit and then select the top display with the [A/B] key. Now go back into menu 34. Menu 34 will be set to "A".

And on some firmware versions OFF was removed (it sound like this is what you have) so A was shifted to the memory location that used to be OFF and B was shifted to the memory location that used to be A. That make CHIRP's OFF and A equal to the radios A and B.

So if you have an older radio where TDR-AB sill forces priority, CHIRP works as expected. But if your have one of the new radios where Baofeng changed the behavior or menu 34, then CHIRP won't work. It doesn't matter because setting it from menu 34 won't do anything useful either.

As I said, if it isn't needed I avoid it. This is my only computer and replacing the same software ever week or two just doesn't seem to do anything except risk (though small) a corruption of some kind. If there is a benefit I do it.

Two months old? Why not the latest build?

Thanks Jim. That make sense though I haven't seen it written on Chirp or Miklor. But then I don't review everything every week, so I may have missed it.

I'm guessing the $200 was far too low an estimate, probably billed his insurance carrier $750 for an off-hours visit, another $250 for "prescribing" an ambulance, and another $250 for messing with his golf tee-time. It's really no wonder why our insurance rates are so high.

The "risk" is only in your imagination. Dan Smith KK7DS is constantly adding additional capabilities, model support etc. with each new release. Using his free software for over 1-1/2 years (updated at every available opportunity) on multiple Baofeng, Yaesu and Icom radios has never met with a problem in my experience.

I greatly admire those who make their intellectual property available at no cost ... that's why I use Linux for everything. No clone USB cable problems here.

Does anyone know of instructions on how to program the UV-B6? I got the disc and the cable, but there is nothing at all in the manual on how to program this thing.

Also, does anyone know if you should be broadcasting on WIDE or NARROW if you are simply talking to the local VHF repeater? What is the difference between WIDE and NARROW?

(My unit only has 27 steps through the menus. I see where some units have many more steps)

Also this thing was advertised on Amazon as putting out 5W -- which it isn't. Does anyone know anything about that? Are there BAO-Feng units that really do put out 5W? Am I supposed to be putting out 5W? If so maybe I just have a bad unit and need to exchange it via Amazon.

Thanks in advance!
Dave

When there is no OFF in the radio, the setting can't be programmed anyway. The setting follows the selected display.

When the Settings menus disappear, it is usually due to one of the settings being out of range. Usually looking at the debug.log file can reveal what setting is out-of-range.

Pop some more pills, Tony, if you have issues with how doctors overcharge
their patients.

Subject: Re: [baofeng_uv5r] Chirp or User Bug?

When there is no OFF in the radio, the setting can't be programmed
anyway. The setting follows the selected display.

When the Settings menus disappear, it is usually due to one of the
settings being out of range. Usually looking at the debug.log file can
reveal what setting is out-of-range.

The "risk" is only in your imagination. Dan Smith KK7DS is constantly adding additional capabilities, model support etc. with each new release. Using his free software for over 1-1/2 years (updated at every available opportunity) on multiple Baofeng, Yaesu and Icom radios has never met with a problem in my experience.

I greatly admire those who make their intellectual property available at no cost ... that's why I use Linux for everything. No clone USB cable problems here.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

The problem is that Baofeng has basically ruined TDR-AB. There are at least three ways it works now. CHIRP supports the original way where you have 3 choices (OFF, A and B) and chosing A or B forces priority to the selected display.

On the most recent radios, the TDR-AB setting is no longer relevant. You can change the menu setting, but it means nothing because the setting will track the display selected by using the [A/B] key.

Try it. Set menu 34 to "B". Exit and then select the top display with the [A/B] key. Now go back into menu 34. Menu 34 will be set to "A".

And on some firmware versions OFF was removed (it sound like this is what you have) so A was shifted to the memory location that used to be OFF and B was shifted to the memory location that used to be A. That make CHIRP's OFF and A equal to the radios A and B.

So if you have an older radio where TDR-AB sill forces priority, CHIRP works as expected. But if your have one of the new radios where Baofeng changed the behavior or menu 34, then CHIRP won't work. It doesn't matter because setting it from menu 34 won't do anything useful either.

From: camposvazquez@...
Topic: 50116 Message: 50116

my name is campos..

i am in the los angeles/california area. are there any groups or clubs out here that are specifically using this radio?

i have been reading countless reviews online, amazon and write ups on HAM.

this radio is the overwhelming favorite for the beginner..

i picked up 2 radios with all accessories including the Nagoya antennas and usb programming cable for under $58 shipped on eBay.

i went to www.miklor.com and saw this Yahoo group listed...amazing.

i have viewed 50 plus videos on setting these up...i am very excited.

i am a weekend racer and i will try and make see igf i can make these radios work between the pit crew(buddies) and inside the car....these might require 2 radios inside the car...

at the moment i am trying to access the oldest posts on this forum from February 2012 and read from there. ..for some reason my cell phone won't allow me to access then...perhaps i need to use a pc for that?

i wanted to say hello and become a productive member of the HAM and UV-5R communities..

1992... I was a Jr. FF/PM, saved a guy's life by performing CPR, Defib, drugs, etc etc etc...

2 months later, I get slapped with a lawsuit for saving his life, went ALL THE WAY in front of the judge, when asked about the incident, he told the judge "...I just wanted to die. That's why I took a double dose of insulin and didn't eat..."

The judge looked at the guy, dismissed the case, told the bailiff to take him into custody for a 72hr hold for attempted suicide. He the admonished the attorney who filed the case telling him that if he ever saw such a case again that he would hold the attorney in contempt of court.

So yeah... they are out there.

Bob,

It isn't new. The GT-3 Mark II has been available since at least November 2014. The GT-3 Mark III since at least January 2015.

I would expect the differences between the GT-3, GT-3 Mark II and GT-3 Mark III to be mostly marketing hype. It does look like it comes with a better antenna, though.

The GT-3 programs the same as the UV-5R, but I have to say that the GT-3 (UV-5X and FF-12P) has a little different chipset in them. They scan a little faster, have a little better mic gain, and seem to be a little lighter. Performance wise? I don't see THAT much difference. Personally if someone was handing me one for free, I would take the UV-5R over the GT-3 due to the availability of batteries etc etc etc....

BUT I do like the UV-5X and the FF-12P better than the UV-5R, it's just there's no chance of extended battery or any good cases out there.

Just my two cents...

73
James
W8JVF

P.S. Also, I've bought from Radioddity (Sain Store) quite a few times. Their option of DHL shipping for less than $14 is a BIG plus. And if you order $150 or more, shipping is free. Also, if you put more than $200 in your cart they give you another $10 off. I'd wait until labor day, because they may run another sale like they did last year, and mark down a LOT of their inventory.

You can't go by that. When the GT-3 first came out, it was the first
to get the new chipsets. Then once the old chipsets were depleted, the
UV-5R got the same thing. Firmware version for firmware version, the
UV-5R and GT-3 are the same electronics in a different case.

>
> it was also mentioned that the gt3 has been discontinued by baofeng/pofung..

Depends on if you consider the GT-3, GT-3 Mark II, GT-3 Mark III and
GT-3 TP the same or not. I consider them all the same, so to me they
are still in production.

>
> are the uv5r accessories like upgraded battery...handsets interchangeable
> with the gt3 anf bff8+

No. Basically all the electronics inside is the same, the shell on the
outside is what is different. Buy what the model that looks good to
you or buy the mode that works with the accessories that you need
(hopefully you can find a model that does both).

The GT-3 is not compatible with the classic UV-5R battery or the
extended battery. It even has a ridge that goes around the speaker/mic
port that can cause problems getting some programming cables and
external mics to seat fully in the socket.

>

I'm laughing out loud at the thought of UV-5R owners all over the world falling out of their chairs when they see some ham radios selling for $3,950.00. To them, that's like 140+ UV-5R's. I wish the poster well, but I think the odds of Baofeng owner's (on this forum) even knowing radios cost that much are slim indeed (there are, of course, a few exceptions - but darn few).

Bruce,

I hate to bust your bubble, and anyone else reading this, but Good Samaritan Laws do NOT keep you from being sued. They only keep you from LOOSING a lawsuit.

Anyone ... and I mean ANYONE can sue ANYONE for ANYTHING... you can file papers and initiate a lawsuit against someone who passes by you on the street and saves your life with CPR because you felt they damaged you in some way. Where the Good Samaritan Laws protect you is that they have to prove that you intentionally tried to cause harm and a couple of other things (the terms are escaping my brain right now).

Your homeowners insurance actually has personal liability built into it just because of this. Usually what happens is that during the discovery phase, the case is thrown out, but there are still attorney fees to get to that point.

I live in such a state and when CPR/AED/First Aid trained the law was explained in detail. You still have to take some precautions. As an example; if someone refuses potentially life saving treatment, do not touch them UNTIL they pass out. THEN you can do what should be done to save his/her life under the presumption that they would want to be saved.

Who knows if that is correct, but that is an example provided by the fireperson who provided the training...

Wow, how did this derive from a Baofeng question...

Without getting too legalistic, what is being described here is "implied consent." Absent a DNR/MOLST or living will, an unconscious victim is presumed to have given consent for life saving acts.

Jim is correct, they all should be getting the newer chipsets. However, some older boards maybe around that have not been flashed yet held by those that make their own knockoffs.

The GT3 does have a cool cosmetic look and the antenna is different (do not know if it is electrically different) the GT3 came in the smaller new boxes. Now they all do too with my latest Part90 stickered Uv5R’s coming in the smaller box set too.

Should be no difference and most likely the Uv5R design is at its design limits to really change much more than cosmetics anyway.

Having a 256 memory would be nice and possibly a go without that much of a redesign. Changes are going to be firmware changes (like the TDR and scan changes and case style or accessory changes.

The A58 was a change a hybrid of the uv5R inside and a beefed up uv82 looking waterproof look on the outside. Problem is this has been a low sales item because it costs double the uv5R. So we cannot even sell them less or at the Amazon price. (That includes custom programming too)

Their mobiles are not selling well either as a single band unit- so Baofeng/Pofung has painted themselves in a corner as only a source for under $50 radios with various cosmetic changed versions. I do not see them spending big $$ on production costs to make a huge change in the uv5R’s if those other models listed above are not selling well.

The point being all changes are almost all cosmetic.

Regardless of the sales hype.

You can't go by that. When the GT-3 first came out, it was the first
to get the new chipsets. Then once the old chipsets were depleted, the
UV-5R got the same thing. Firmware version for firmware version, the
UV-5R and GT-3 are the same electronics in a different case.

>
> it was also mentioned that the gt3 has been discontinued by baofeng/pofung..

Depends on if you consider the GT-3, GT-3 Mark II, GT-3 Mark III and
GT-3 TP the same or not. I consider them all the same, so to me they
are still in production.

>
> are the uv5r accessories like upgraded battery...handsets interchangeable
> with the gt3 anf bff8+

No. Basically all the electronics inside is the same, the shell on the
outside is what is different. Buy what the model that looks good to
you or buy the mode that works with the accessories that you need
(hopefully you can find a model that does both).

The GT-3 is not compatible with the classic UV-5R battery or the
extended battery. It even has a ridge that goes around the speaker/mic
port that can cause problems getting some programming cables and
external mics to seat fully in the socket.

>

They got the newer versions of the Chipsets that came out. You can find the enhanced specs of the series looking at the data sheets. More than likely you would not be able to tell the difference during operation. Why this upgrade was important though was the fact during the time this upgrade came out you knew you were not getting one of the defective boards with the mic/speaker jack issues.

The release of the GT3 came out right around the time the bad jack versions came out.

During this bad jack and other QA issues, most US based sellers switched to the BF B8 or other models or went out of business/stopped selling them.

Maybe someone from this group will think that 3,950 was a typo and really 39.50 and contact him. Of course at $39 they will ask what free accessories they will get with the Icom or Kenwood.

One good thing about the majority of the uv5R buyers that feel “I will never get licensed/don’t care” is that We will never hear them on $$$ HF.

Maybe that is a good thing.

I'm laughing out loud at the thought of UV-5R owners all over the world falling out of their chairs when they see some ham radios selling for $3,950.00. To them, that's like 140+ UV-5R's. I wish the poster well, but I think the odds of Baofeng owner's (on this forum) even knowing radios cost that much are slim indeed (there are, of course, a few exceptions - but darn few).

One of the scams a few months back had an address 3 miles away from my location- I actually went there to see what was around that area.

The address was a Check Cashing/Payday loan place. No elderly Ham selling their HF equipment. I posted this info on QRZ.

These crooks are desperate, the problem is that sooner or later they do get a sucker on their fishing line.

All too true about the scammers. If the call(s) began with an XE3 prefix then it could have been 3,950 pesos, but then that's still around $250 USD and well outside the range of many on these forums.

Topic: 50156 Message: 50158

They are set at the listed specs. for the repeaters .
example
fq = 447.8000
mode = tone
tone =107.2
tone sq = 88.5 (default)
cross mode = tone tone
dtcs =23 (default)
rx dcts = 23 (default)
dtcs pol = nn (default)
duplex = -
offset = 5.0000
mode = fm
ptt id = off

What am I missing I have other repeaters in san diego set up and had no problem.
I don't know if they still work since I down loaded a new image with the local repeaters.
I just updated chirp maybe maybe something in the settings has changed.
I checked them and made changes to match my image file.
thanks in advance
bill

Not too sure if you meant you are not opening the repeaters yourself, but can hear others doing so, (If so, ensure you have the correct offset configured, along with the necessary CTCSS tone), or...

You can open the repeaters, (and maybe listened on another rig to prove the point), but your UV-5R is not receiving them, although you can see an incoming signal. In which case, you do NOT want a CTCSS set for receive.

If the latter, it is possible that the one repeater you do hear either intentionally sends a CTCSS tone when it is on air, or, more likely, it repeats the CTCSS tone of the station transmitting to it. In Amateur service it is pretty much that you never need a CTCSS tone in your receiver.

This all applies in the UK, and I have seen this stated many times for you guys over there as well.

HTH,

73 de Stan, G4EGH

It sounds like you are kerchunking the repeaters and hearing the repeaters. But you don't hear anyone using it. Am I correct in that statement? I would say monitor one of the ones that you can hit and see if you hear anyone use it. Also make sure the receive PL is turned off as a lot of repeaters do not transmit with a PL tone. You need one to get in, but not out.

Which repeaters are they?

I am in San Diego right now until tonight at Del Mar fairgrounds

If you are near Del Mar bring your radio in to the Cross Roads of the West show and look for our radio tables, I will take a look at it.

Someone has been dumping Firmware 251 versions online as I have had 4 people with issues with that outdated Firmware ask for help in the last 2-weeks.

Some repeater book repeaters are inop, paper only. However, you should be able to get at least one or so.

Will be here till 6pm the show closes at 4pm though.

Subject: [baofeng_uv5r] Help with repeaters

I have a uv5r firmware 251, I have programed 10 repeaters in my area and only one works.
I know I am reaching them because I can hear them coming on but no voice transmission?
I am using chirp any Ideas on what I am doing wrong.
All of the repeaters are listed as open.
thanks
bill

Trying to find a way to obtain current fresh radios from Baofeng Tech/Amazon, I posted the following on Baofeng Tech's Facebook page a few days ago. This represents my and others' experiences. They have made several posts and replies to others since then and ignored this post, but didn't delete it I find it rather interesting and telling:

"Is there a way to order your current new stock? I order these (BFF8+ and UV82) from Amazon (Baofeng Tech seller) and often get very old firmware which has bugs now long since corrected and previous returns with defects and obvious wear. I stopped buying these from Amazon due to this. I know about FBA fulfillment and that may be why this is happening."

You want guaranteed current firmware?

Try http://www.buytwowayradios.com/products/baofeng/uv-5r.aspx -- $39.99 luck of the draw or +$10 to guarantee latest firmware.

They also provide the A-V85 antenna in lieu of the poor stock antenna.

And they sell a "kit" for $69.99 with mic, NA-701 (guaranteed genuine), extended battery, battery eliminator, and programming cable.

Yeah…you can find cheaper elsewhere but good luck with that. These guys are brick&mortar, I've dealt with them a number of times with good customer support, and they've been around for quite a while.

I believe in patronizing good businesses….and for the UV-5R there are few choices.

Not that this applies to BaofengTech per se, but since the same seller owns both BaofengTech and AnytoneTech websites (and uses Amazon for FBA shipping), I thought some might be interested in a message received from Amazon when I inquired why both the TERMN-8R and the OBLTR-8R aren't even on Amazon's website right now (normally a item would indicate a backorder, but these two units are totally gone):

"*These products have been identified as a device that emits a radio frequency and that does not have the required Federal Communications Commission (FCC) license. Amazon policy prohibits the sale or listing of any product on Amazon.com that is unauthorized for sale in the US*."

So does that mean that every TERMN-8R and OBLTR-8R units sold (prior to Amazon's de-listing) should be returned for a refund? Will AnytoneTech (or Amazon) notify folks that purchased the non-authorized radios?

I don't see any mention of this non-FCC certification issue on AnytoneTech's website, merely a posting that the two radios will be back in stock on May 27th. While I support Amazon's decision, you have to wonder when/if they will ever go after the hundreds of other sellers that continue to dump non-FCC certified Baofeng's on the market through their FBA service, and yes, that would also include the non-FCC certified (at least my two units) of the BaofengTech BF-F8HP radios.

Ok

I found a supply but they costs more than most want/think they should pay for. Hard to find a Part 90 stickered version for $30. We get request for them but the prices end up around $49 which includes the 9% sales tax.

That is $20 more than what most want to pay. Seems the stickered versions run $15 more for the uv5R

Interesting, I thought they had the certifications?

If not, that would be a huge loss to absorb for that company. You’re right, they would go after AT or BT (USA based biz) and shut them out while not doing anything to stop the more unscrupulous sellers located outside the US.

Sounds like the Obama admin runs Amazon too with that policy.

Actually FRS and MURS are not license free, they are license by rule. There is a difference. That means individuals don't have to get a license, but it also means there are specific rules that apply to their use, including using approved radios, which Baofeng's are not.

I'm sorry you feel that for your use and operation, that legality is not a concern. If you do decide to delve into ham radio, please also understand there are reasons for rules and legalities, and it is appropriate to abide by them.

From: Craig Carnahan craig.n7lb@... [baofeng_uv5r]

> Some hams will absolutely want to call you out on this,
> others not so much, especially since a high percentage
> of them program in those frequencies as well, but for
> "emergency use only" (yeah, right).

For a lot of hams this isn't so much a "Do as I say, not as I do" but more of a "Know when to keep your mouth shut" or "Ask me no questions, I'll tell you no lies."

It is somewhat like speeding in your car -- you know it's against the law, so smart people don't flaunt it either by bragging where the wrong people are listening or by doing it in ways that attract attention.

For older hams who still remember when the FCC actually had enforcement teams, the thinking is still something like don't poke the bear.

For many newer hams, there really isn't any thinking involved, they don't realize that there ARE rules and can't understand why others think they ought to at least pretend to obey the rules.

The non-labeled radios are coming almost certainly coming from wholesale operators in China -- radios bought direct from BaoFeng and shipped by BaoFeng direct to the US come with the label but that involves meeting their minimum order quantity, etc.

You want guaranteed current firmware?
Try http://www.buytwowayradios.com/products/baofeng/uv-5r.aspx -- $39.99 luck of the draw or +$10 to guarantee latest firmware.
They also provide the A-V85 antenna in lieu of the poor stock antenna.
And they sell a "kit" for $69.99 with mic, NA-701 (guaranteed genuine), extended battery, battery eliminator, and programming cable.
Yeah…you can find cheaper elsewhere but good luck with that. These guys are brick&mortar,

I've dealt with them a number of times with good customer support, and they've been around for quite a while.
I believe in patronizing good businesses….and for the UV-5R there are few choices.

Trying to find a way to obtain current fresh radios from Baofeng Tech/Amazon, I posted the following on Baofeng Tech's Facebook page a few days ago. This represents my and others' experiences. They have made several posts and replies to others since then and ignored this post, but didn't delete it I find it rather interesting and telling:

"Is there a way to order your current new stock? I order these (BFF8+ and UV82) from Amazon (Baofeng Tech seller) and often get very old firmware which has bugs now long since corrected and previous returns with defects and obvious wear. I stopped buying these from Amazon due to this. I know about FBA fulfillment and that may be why this is happening."

> bfb297 is what it reads... at least that means it is a newer radio.

Actually, no it doesn't. The BFB297 firmware version came out over 2 years ago. Every UV-5R variant since BFB299 reports BFB297 (except BFS313 which reports BFS297) when powering on the radio with the [3] key pressed. This method is no longer a reliable method for determining the firmware version. CHIRP must be used to determine the "real" firmware version.

Xaun, That isn't entirely true. To receive radios with the Part 90 stickers, the ordering dealer has to specify the need for the Part 90 certification stickers, or they will still be shipped to the US without any stickers attached. I had a couple orders come in sans the Part 90 stickers and they had to ship the stickers to me after the orders were received.

From: Emyr Morris
Topic: 50184 Message: 50190

Probably high SWR, low battery or incorrect frequency setup. I had this problem with my first Baofeng. Managed to clear the problem after completely reprogramming using the very latest daily build of chirp.

I noticed it didn't happen in VFO mode hence the conclusion that the programming had gone bard.

i Tully appreciate everyone's informative posts.

i only need comm for a 2 mile point to point distance.

I hope my posts are viewed as bragging that was not my intention

murs is the choice since those channels are not used in my area.

I will be using radio etiquette and those five and urs channels would be
used to communicate with my brother a two mile or less distance

The cost of the Motorola, Uniden units was far more than what I paid for my
UV5r's

I joined this group for information and I received it I am very grateful

when pressing the push to talk, does the display blank out? If so, either a battery problem, or the TX circuitry is gone, shorting out. A good guess.

Is the price the same or do they try to tack on $10 for the sticker versions. I generally do not carry straight uv5R's but got the Part 90 versions in doing a favor for groups needing them.

Of course any extra cost to me is passed along to the customer base.

Stuck speaker jack or loose SMD joint.

Try pressing on the plate where the jack is sharply with a blunt object and see if the audio comes back.

If so it is a nSMD solder joint or a jack contact that was flexed (warped) by that jack plate.

Would you happen to be using an AA-cell case with 6 alkaline cells? If you are, the voltage is too high (6 X 1.5 = 9.0 volts). When using alkaline cells, 5 cells plus a dummy cell are used (5 X 1.5 + 0 = 7.5 volts). When using rechargeable cells, you can use 6 cells (6 X 1.2 = 7.2 volts).

WD-40 fixes a fan of mine for a day.I'm going to have to open it up andclean it then use lithium grease soit stays fixed for more then 6 hours.

Remember, it's the 40th version of a Water Displacement formulation.

Subject: Re: [baofeng_uv5r] Is this new HT any good

Actually FRS and MURS are not license free, they are license by rule. There is a difference. That means individuals don't have to get a license, but it also means there are specific rules that apply to their use, including using approved radios, which Baofeng's are not.

I'm sorry you feel that for your use and operation, that legality is not a concern. If you do decide to delve into ham radio, please also understand there are reasons for rules and legalities, and it is appropriate to abide by them.

From: Xaun Loc
Topic: 50171 Message: 50210

OK, that might be a change -- I'm not a dealer but I had been told (by more than one) that the radios being shipped to the US directly by the factory were automatically coming with the US label while radios originally sold in China came with the required Chinese domestic label (which oddly enough is printed in English, including the English acronym for the name of the Chinese government agency regulating radios)

From: mailto:baofeng_uv5r@yahoogroups.com

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Part 90 Labels

Xaun, That isn't entirely true. To receive radios with the Part 90 stickers, the ordering dealer has to specify the need for the Part 90 certification stickers, or they will still be shipped to the US without any stickers attached. I had a couple orders come in sans the Part 90 stickers and they had to ship the stickers to me after the orders were received.

Kurt - K5KJK

To: baofeng_uv5r@yahoogroups.com
Sent: Tuesday, May 19, 2015 3:35 PM
Subject: Re: [baofeng_uv5r] Part 90 Labels

The non-labeled radios are coming almost certainly coming from wholesale operators in China -- radios bought direct from BaoFeng and shipped by BaoFeng direct to the US come with the label but that involves meeting their minimum order quantity, etc.

Ok

I found a supply but they costs more than most want/think they should pay for. Hard to find a Part 90 stickered version for $30. We get request for them but the prices end up around $49 which includes the 9% sales tax.

That is $20 more than what most want to pay. Seems the stickered versions run $15 more for the uv5R

You want guaranteed current firmware?
Try http://www.buytwowayradios.com/products/baofeng/uv-5r.aspx -- $39.99 luck of the draw or +$10 to guarantee latest firmware.
They also provide the A-V85 antenna in lieu of the poor stock antenna.
And they sell a "kit" for $69.99 with mic, NA-701 (guaranteed genuine), extended battery, battery eliminator, and programming cable.
Yeah…you can find cheaper elsewhere but good luck with that. These guys are brick&mortar, I've dealt with them a number of times with good customer support, and they've been around for quite a while.
I believe in patronizing good businesses….and for the UV-5R there are few choices.

Trying to find a way to obtain current fresh radios from Baofeng Tech/Amazon, I posted the following on Baofeng Tech's Facebook page a few days ago. This represents my and others' experiences. They have made several posts and replies to others since then and ignored this post, but didn't delete it I find it rather interesting and telling:

"Is there a way to order your current new stock? I order these (BFF8+ and UV82) from Amazon (Baofeng Tech seller) and often get very old firmware which has bugs now long since corrected and previous returns with defects and obvious wear. I stopped buying these from Amazon due to this. I know about FBA fulfillment and that may be why this is happening."

You are right about WD40. I used to work for an office machines company long ago and they tried a number of cleaners/lubricants to resolve contact bounce and micro corrosion in their keyboard switches (before Hall Effect switches). WD40 was proven to dissolve or weaken many types of plastics over time. NEVER spray it in anything made of plastic. Some plastics like ABS weren't so effected, but others turned to crumble in less than a year. What they settled on was Workman Products lube, but sadly it too weakened some plastics (the keyboard switch cover) just over a much longer period. Using Deoxit is using a product designed for this and I just looked up the price having not purchased it in a long time. WOW!

From: Chuck Burns
Topic: 50113 Message: 50212

I enjoy reading your posts, which are at times strongly worded and to the point. I would like to add my opinion about is the UV5 HandiTalkie any good?

For my situation, The Baofeng UV5 series of handi talkies are just about the best bang for you buck transceivers you can buy. No they are not in the same league with the Kenwood, Icom, and Yaesu and are not meant to be. You can buy them ten at a time for $30 a radio.

I recently got my HAM license and have 9 of the UV-5's on hand. The beauty of this little radio is that it is so inexpensive as to be disposable. You can get them delivered in the $35 range. But I have yet to have one fail.

They work quite well for local situations and I get reliable communications at distances up to 4 miles in my area. Distances for your situation may vary.

As for the legality or illegality issues Xaun Loc wrote an excellent post that spells that out quite well and really nothing more needs to be added*.*

I advocate getting the HAM license. It is so easy today that there is just no reason not to get licensed.

And finally, my main purpose for having the UV5 is local communication in an emergency or WROL scenario which I think is self explanatory in regards to using all the frequency capabilities of the UV5.

So is the Baofeng UV5 any good? It satisfies my needs perfectly.

Seriously, have you accidentally enabled receive CTCSS that might be muting the audio - I can not remember if you get the green light and no audio if this is enabled?

maybe somebody else can enlighten. I know that on my Motorola GP340 units if the channel is busy but has a different tone the light comes on but no audio comes out.

Kindest & 73

i too received one uv 5RC 20 days back
i had similar trouble of no audio.
luckily i had rtl sdr wit me
when i tuned that , there was no audio.
here there are other agencies who work ion 165MHz
I could hear audio there and confirm my transceiver is not faulty.

50217. Baofeng Accessories for sale

Yahoo group: baofeng_uv5r (2015)

From: af5cc@...
Topic: 50217 Message: 50217

I have for sale 2 optional accessories for Baofeng HTs The first is Baofeng speaker/mic. Works with most Baofeng/Wouxun HTs except the UV-3R. Will work with UV-3R plus. For the UV-82 it will work, except on that HT you can only transmit on the B VFO using the speaker/mic.

The second item is a SO239 to SMA jumper coax/adapter. Allows you to connect the Baofeng to an external antenna. Radio Shack sells these for $20.

I am asking $17 shipped for the package. I can take Paypal/check/MO.

I do have a Baofeng UV-82 I would consider selling as well.

I've already documented a customer's issue (with 50 Baofeng UV-5R radios his purchasing department ordered through Amazon). I forget the exact number, but something like 35 or more (of the 50) arrived without Part 90 certification labels. I don't know if his return (of the entire lot, as there were other issues with most of the radios and it's too expensive/time consuming to troubleshoot all 50) may have been what prompted Amazon to look into the lack of Part 90 certification on sooooo many radios they have (or had) for sale.

That may have been what tripped up AnyTone Tech, as their two big sellers aren't even on the Amazon website at this point. Of course, the Anytone forums have also been quite busy blasting them as well, so who really knows? I'm sure they (Anytone Tech) will scramble in an attempt to get FCC certs, but if their big claim to fame was GMRS/MURS approval, that may be difficult. You might very well just see them resubmit without trying for GMRS/MURS FCC approval and simply repackage the radios as "new and improved" models in a few weeks.

It's just a guess, but I'd bet that different models of the TERMN-8R and the OBLTR-8R will appear within a few weeks that only claim Part 90 certification (for now at least). I can't imagine anything the FCC does can happen fast enough to allow either radio to be back on the market with both Part 90 and Part 95 certs before mid-summer.

Hey guys,

I hope this type of content is welcomed here.

I¹ve been custom building IRLP micro nodes, sometimes using the UV-5R. If you¹re curious about the design please take a look.

Jonathan,

I'd say the content is OK. But you should have started new thread about "IRLP micro nodes" instead of hijacking this one about "Part 90 Labels".

Jim

Hmmm, that's odd that only VFO B ("bottom" presumably) will tx with an external mic. Both mine work on both VFO's, so I probably can't answer that one.. However, John, be a bit careful using a speaker mic on the UV-5R.. They have a tendency to cut your receive. After a while your UV-5R may have no audio on the receive when you take the speaker mic out. Why,,?? Apparently the speaker jack must be made of poor quality steel and the make/break part "might" lose it ability to spring back to its original position leaving your audio circuit open... No audio...!!!

I have for sale 2 optional accessories for Baofeng HTs The first is Baofeng speaker/mic. Works with most Baofeng/Wouxun HTs except the UV-3R. Will work with UV-3R plus. For the UV-82 it will work, except on that HT you can only transmit on the B VFO using the speaker/mic.

The second item is a SO239 to SMA jumper coax/adapter. Allows you to connect the Baofeng to an external antenna. Radio Shack sells these for $20.

I am asking $17 shipped for the package. I can take Paypal/check/MO.

I do have a Baofeng UV-82 I would consider selling as well.

Setting Menu 8 (Beep option) to Off has been a known problem with "some" Baofeng radios since the introduction of the BF-F8HP units. If setting Menu 8 to Off also blocks your incoming audio, then it would appear that Baofeng is now (or was if the now have stopped the practice) installing boards with the same problem (as the BF-F8HP units) into standard UV-5R radios.

No but being shorted will affect receive.

Craig,

The first BF-F8HP radios shipped in May of 2014, had "BFP3V3" firmware and weren't affected by the BEEP bug.

Radios with the BEEP bug began appearing in late summer/early fall 2014. The BEEP bug affected models that introduced the N5R-30 firmware (radios with 3 power levels -- the BF-F8HP (and possibly the Intek KT-980HP which came out months before the BF-F8HP)) and models with N5R-20 firmware (radios with 2 power levels -- the UV-5R and its many variants).

The bug was "fixed" in the September 2014 firmware releases but the firmware version wasn't changed. One had to look at the date in the [6] key + Power-on message to see if it was "140901N" or later.

It is possible that Baofeng found some old boards in inventory or is using some refurbished boards in some of their recent shipments, but I feel it is more likely that any radios purchased today having the BEEP bug is due to the sale of "new old stock".

Jim KC9HI

That's certainly a possibility Jim, but since Baofeng tends to not share any data regarding their stock levels or changes between rev levels, no one really knows. The problem with the "new, old stock" issue is that it's virtually impossible (without spending a great deal of time) for any dealer to know what rev level the radios are that they are selling (and certainly no one selling them on e-Bay or Amazon is going to know or care).

50236. UV-82 alpha tags

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-23 07:47:26 UTC
From: kc9eev@...
Topic: 50236 Message: 50236

Hello group,
I've programmed alpha tags for each freq into the radio with CHIRP but I've not yet figured out how to have the radio display them rather then the freqs. So, is this possible and if so how do I get it done please?

50237. Re: [baofeng_uv5r] UV-82 alpha tags

It's in chirp settings. An option to display a or b window as name, frequency and one other option I don't remember. Just figured it out myself.

I had the same problem and this is the FIX I received:

Press Menu + 21
Display will show "MDF-A" press Menu and step to NAME + Menu & Exit
Press Menu + 22
Display will show "MDF-B" press Menu and step to NAME + Menu & Exit
Your Display should now show NAME not Freq's.

It really means hit menu then hit one then hit menu. Not like on a computer where you hit two keys at the same time.
I hope this helps

Jerry,

When you RESET the radio, it is reset to the firmware defaults (which are different from the radio ships from the factory). Use menu 14 (VOICE) to set it back to ENG.

These radios are actually easy to program once you understand how they program. To program a repeater it takes two writes using menu 27 (MEM-CH). The first time with the VFO set to the RX frequency creates a simplex channel on the RX frequency. The second time with the VFO set to the TX frequency updates the original TX frequency to the lower (or higher) frequency.

In addition to the great guides on the miklor website, I also recommend that you take a look at the WP4AOH blog.

http://wp4aoh.blogspot.com/

Attachments: 1 described; binary payloads are missing from this source WARC

I want to be able to get ATIS (aviation field weather) on the way to the airport and pick up clearances etc without starting the airplane avionics and drawing down the aircraft batteries.

I can dial in the frequency without getting the cancel message but don't hear anything even though when I know there is an active full time repeating transmission.

I'm including the .img file of that profile.

So..... why no reception? I also tested transmission while receiving with another aircraft radio to be sure it wasn't a squelch issue.

In the meantime, I've figured out how to get channels programmed, named, and the names displayed....

FAQ 2.3

2.3

Can I receive Aircraft frequencies
No. They are out of the radio's frequency range.
Also, the Aircraft Band is AM while the UV5R is FM only

I may be wrong but isn't aviation AM not FM?

Yep, something was niggling at me about that. Aviation VHF voice is AM. Partially because it was the prevalent technology at the time. Also takes less power to transmit and being range limited allows for more ground stations able to use the same frequencies without bleeding into each other.

The aviation one looks like 136

The rest are the 4 wheel freqs of the off road sand pit areas of CA. Those you should get.

Most are running Wouxun uv8D’s and quad band 950P versions in this area with repeaters in SD, Riverside and San Bern county.

Getting a license is easy these days, I would get your Ham tech license so you can use repeaters in the area. They get the Wouxun because the channel capacity is 999 and everything from S Barbara to the Mexican border to AZ to Vegas is preprogrammed in them.

I know a case where someone flipped their dune buggy and cell phones did not work, it was a Ham that was able to get help. Some use the Sand Limo for minor breakdowns I guess they flipped and were trapped/.

Do not run the radio inside the vehicle for xmt, these are simplex so it is better to have an external outside antenna as the terrain in this area is rugged and best used with a good external antenna using a BNC Male end
\
Use the SMA F to BNC F connector on the radio. Fry’s off the 60 and 605 has them.

Good reports when using a decent mobile antenna in this area. You might want to go to HRO in Anaheim and get the version that can operate in the Ham and 150 mhz ranges since most of the off road freqs there are in the 150’s or a cheap Nagoya UT 108

BTW if you are near an airport you can still hear AM coming through the discriminator, it sounds strange but still can hear something. I can hear tower stuff at the Chino and Corona AP’s even though it is FM when near.

Look at a Zastone ZT 2R+ for aircraft freqs. I am testing out a AT 3318 E model that can do AM AB but the Zt2R is a copy of the Yeasu vx2R and has 999 channel storage.

Cool little radio too.

Hmmm, I think you might need a little more study into VHF radio coverage the and AM mode too.It doesn't take less power to transmit. In fact 80% of the power requred to generate an AM transmission is wasted in generating the carrier and one redundant sideband.

Moreover, the line of sight transmission range characteristic is a function of the frequency, not the mode in use.

AM hangs on in aviation because, as you say, it was the mode in general use at the time the international aviation community adopted it and to change now would require the change to be made simultaneously and universally, something unlikely to be achieved given the huge number of AM Airband transceivers in use throughout the world.

In addition to that consideration, there is the advantage that there is no capture effect with AM, unlike FM. If stations transmit at the same time, or double as we call it, the interference can be heard and the receiving operators know that there is more than one station transmitting. On FM, the capture effect generally means that only the strongest station can be heard.

Safety .... no capture effect when two AM stations (aircraft) talk
at the same time. ATC can usually tell when one aircraft transmits on
top of another.

Not so simple if using FM.

Your license does not permit use of uncertified radios -- such as these. But it really doesn't matter because they CANNOT actually operate on your frequency even though you can set the radio to allow you to enter those numbers. ALL you get is the numbers showing in the display, the circuitry in the radio is still physically unable to operate there.

FAQ 2.3

2.3

Can I receive Aircraft frequencies
No. They are out of the radio's frequency range.
Also, the Aircraft Band is AM while the UV5R is FM only

I want to be able to get ATIS (aviation field weather) on the way to the airport and pick up clearances etc without starting the airplane avionics and drawing down the aircraft batteries.

I can dial in the frequency without getting the cancel message but don't hear anything even though when I know there is an active full time repeating transmission.

I'm including the .img file of that profile.

So..... why no reception? I also tested transmission while receiving with another aircraft radio to be sure it wasn't a squelch issue.

In the meantime, I've figured out how to get channels programmed, named, and the names displayed....

I've never seen any version of a Baofeng radio be able to actually receive AM. I have seen folks muck up their UV-5R's with software mods that allow the radio's LCD to display all kinds of different frequencies, but displaying a frequency and actually receiving it are two different things entirely.

50271. HOT Antenna

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-24 23:15:25 UTC
From: g4xta.paul@...
Topic: 50271 Message: 50271

Does anyone else find their antenna gets HOT about an inch-and-a-half up from the base, during transmit?
Apologies if this has been answered on the group before, but I'm new here and this is my first posting. I've checked through the messages but didn't find anything.

I've had my two new UV5-R camouflage radios for about a month. I've got all the accessories and lots of spare batteries. Great.
But although the rig receives and transmits just as well as any other HT with a regular-sized rubber duckie antenna, I notice that both of my antennas become really hot after about half and hour of QSO.
The rubber becomes so hot that it's hard to hold your finger on it for long, and you can feel the warmth radiating against your face. The heat is localised in a small area about an inch-and-a-half up the antenna. After a while it spreads a little, but never gets as far down as the radio itself. (at first, I mistakenly assumed that the heat was coming upwards from the radio's heat sink under the antenna socket, but it isn't. That stays much cooler).

Obviously, it's wasting a huge amount of power and battery efficiency in heating-up the antenna, when that energy should all be getting radiated as RF signal.

So please, has any reader experienced the same thing? And has anyone found a good replacement rubber duckie antenna made by one of the good brands? Maybe there's an antenna from a Yaesu or Kenwood model that will fit? I want something that is the same size as the original, and all rubber, not an extended one with a hard coil at the bottom and a long whip like the Nagoyas I'm seeing for sale.

Any comments would be appreciated.

If you can bring up the 121.5000 MHz frequency ok, try setting the radio to "NARROW". The AM signal is 6 kHz, set the HT the NARROW FM (12.5 kHz) . You should be able to copy the traffic on the frequency but at a reduced modulation level, so turn up the volume knob.
I listen to the Control Tower at Bradley Field in CT all the time using this method on several of my HT's

With the stock antenna (model A-5R) absolutely on long TX in the UHF band. However with the much improved Baofeng A-V85 antenna, no. That is the antenna which is stock on the UV82 series which looks like a commercial antenna.

---In baofeng_uv5r@yahoogroups.com, <g4xta.paul@...> wrote :

Does anyone else find their antenna gets HOT about an inch-and-a-half up from the base, during transmit?
Apologies if this has been answered on the group before, but I'm new here and this is my first posting. I've checked through the messages but didn't find anything.

I've had my two new UV5-R camouflage radios for about a month. I've got all the accessories and lots of spare batteries. Great.
But although the rig receives and transmits just as well as any other HT with a regular-sized rubber duckie antenna, I notice that both of my antennas become really hot after about half and hour of QSO.
The rubber becomes so hot that it's hard to hold your finger on it for long, and you can feel the warmth radiating against your face. The heat is localised in a small area about an inch-and-a-half up the antenna. After a while it spreads a little, but never gets as far down as the radio itself. (at first, I mistakenly assumed that the heat was coming upwards from the radio's heat sink under the antenna socket, but it isn't. That stays much cooler).

Obviously, it's wasting a huge amount of power and battery efficiency in heating-up the antenna, when that energy should all be getting radiated as RF signal.

So please, has any reader experienced the same thing? And has anyone found a good replacement rubber duckie antenna made by one of the good brands? Maybe there's an antenna from a Yaesu or Kenwood model that will fit? I want something that is the same size as the original, and all rubber, not an extended one with a hard coil at the bottom and a long whip like the Nagoyas I'm seeing for sale.

Any comments would be appreciated.

Depends on how much transmitting in that half hour QSO.

The manual shows the duty cycle to be 03/03/54 RX/TX/Standby.

You may be exceeding the intended duty cycle.

Sorry, Stan, but the UV-5R has NEVER been capable of AM transmit or true AM receive.

Depending on the circumstances, any FM receiver _may_ deliver _some_ receive audio from an AM signal near (not on) the set receive frequency, but this is neither reliable nor does it generally yield consistently understandable audio.

Also the UV-5R has always been able to be set to accept programmed frequencies far outside the span that the circuitry can handle. When so configured, it is possible to display virtually ANY bunch of numbers in the frequency display, but that is all those are - a bunch of numbers - that have nothing to do with the actual operating frequency of the radio. On many occasions, people have set the UV-5R to allow programming frequencies on which the radio is incapable of operating, then claimed that the radio "worked" on those frequencies because they could hear SOMETHING from the receiver.

Bottom line: The UV-5R does not have, and never has had, an AM Aircraft Band capability.

Mmmm.... not quite. There is, or was, a selection in the 5R to turn on the AM aircraft band.

FAQ 2.3

2.3

Can I receive Aircraft frequencies
No. They are out of the radio's frequency range.
Also, the Aircraft Band is AM while the UV5R is FM only

Subject: [baofeng_uv5r] Got BF-F8HP working great but having issue with extending frequency range.

I want to be able to get ATIS (aviation field weather) on the way to the airport and pick up clearances etc without starting the airplane avionics and drawing down the aircraft batteries.

I can dial in the frequency without getting the cancel message but don't hear anything even though when I know there is an active full time repeating transmission.

I'm including the .img file of that profile.

So..... why no reception? I also tested transmission while receiving with another aircraft radio to be sure it wasn't a squelch issue.

In the meantime, I've figured out how to get channels programmed, named, and the names displayed....

I've never seen any version of a Baofeng radio be able to actually receive AM. I have seen folks muck up their UV-5R's with software mods that allow the radio's LCD to display all kinds of different frequencies, but displaying a frequency and actually receiving it are two different things entirely.

No way to know for sure, but I'd imagine that the vast majority of all Chinese radios being sold today (not just Baofeng's) end up on FRS, GMRS, etc., or end-up being used on whatever the pre-programmed factory test frequencies are. Even if every ham operator in the country bought one (unlikely), it's probably still no where near the sales volume of the total Chinese radio market.

We had a customer last week that purchased an RT Systems software/USB cable kit from us for a Wouxun HT and immediately called us and asked where the cable goes into his computer. Informed that the USB side of the cable plugs into the USB port on his computer, his response was classic, "what's a USB port look like?" and "how do I know if I have one?". The really scary part is that these folks also vote and reproduce. Did I mention this chap was already licensed?

Mike, it just shows again how this list has no one manning the rudder. If he said this on 40 meters, if someone recorded him, he would be fined and done enough times, lose his license.

There are two types of people who enjoy spewing hatred on their fellow man. One who knows he is spewing hatred, and enjoys putting others down, so he feels a sense of personal elevation. The second group is much more dangerous. They think they are speaking ‘the truth’ in these matters and don’t understand what they are saying is wrong. I personally blocked this person for a long time. Perhaps everyone else should start to ignore him.

The purpose of the Amateur Radio Service is to help people. I always treat Yahoogroups being here for the same reason, helping people. I hope I am in the majority.

Bruce

Unfortunately this guide will not work for programming repeater channels in 99% of the UV-5R radios that are available. For radios with older firmware, this guide leaves out some very important steps between the first menu 27 write when the RX frequency is stored and a necessary second menu 27 write where the TX frequency is stored.

On these radios with older firmware, you either have to key the TX frequency into the VFO manually or since the guide shows setting up menu 25 (SFT-D) and menu 26 (OFFSET) the radio can simply be put into reverse mode by tapping the [*] key to have the TX frequency displayed. Then write the TX frequency to same memory as the RX frequency was written.

To my surprise, this does work on a UV-5R radio with N5R-219 firmware that I have on loan. This does not work on my BF-F8HP with N5R firmware. So somewhere between the introduction of N5R-20 firmware and the N5R-219 firmware release, Baofeng has added the capability of calculating the TX frequency from the menu 25 and menu 26 settings and storing it the the TX frequency slot during the 1st menu 27 write to the target channel (the second write in no longer required!).

I also noticed that this messes up the current guides guides for use on the newer radios. If you key TX frequency directly and have a value in menu 26 and menu 25 set to something besides OFF, then the TX frequency will be "shifted" frequency and no the frequency that was entered directly.

I would be interested in figuring out which firmware version brought about this change. Any volunteers? If you have a radio with N5R firmware program the VFO with the RX frequency of a repeater and set menu 25 and menu 26 to the correct shift direction and offset respectively. Then write this to an empty memory channel slot using menu 27 one time. Then switch to channel mode, select the channel just programmed in a display that show frequency and tap the [*SCAN] key to put the radio in "reverse" mode. Report back if the display changed to the correct frequency or not.

The short, rigid stock antennas will do that. An aftermarket antenna will correct that.

I think we are in the majority, Bruce, but I do have to sympathize with Craig a bit. I work on computers for a living and it is extremely disheartening to hear this kind of response from a user in 2015, particularly if this person bought the programming cable. This is the information age. With the amount of knowledge on the internet and all the videos and pages that exist for programming these radios there's really not much of a reason to have this kind of repeated question.

That being said it really isn't in the spirit of hams to not be helpful in a meaningful way. Instruct the person how to connect the cable and maybe give a bit more input, like what search term you should use to get info on programming the site. At least pass on miklor.com. I'm pretty sure we all started there. I know I did.

Yes, Bruce, no surprise at all that you'd feel that way. Mike, when someone purchases something that they see demoed at your shop for 10-15 minutes (plugged into the computer) and then decide to purchase it, wouldn't the time to ask questions be then? C'mon guys, when a product for sale says in two different places it comes with a USB cable and you don't know what it is, wouldn't you ask then? Some of you are just going to have to realize that not everyone out there has common sense or an IQ of 100 (average) or above.

I've also had folks buy the software CD by itself (they already had the cable) and then call back to tell me their computer doesn't have a CD or DVD, so how can they install the software? Yes, I suppose they "could" have just purchased a computer for the first time ever 10 minutes earlier at BestBuy and then rushed right over, but the more likely response is that they are just clueless in today's technology world.

That doesn't mean we don't try to help them, but it's also quite sad that so many adults aren't as smart as a fifth grade student.

"*If he said this on 40 meters, if someone recorded him, he would be fined and done enough times, lose his license.*"

Wow, Bruce, I'm not sure where to even start with that utter nonsense.

Bruce, since you're a Technician Class license holder, perhaps you think the FCC has both the ability to monitor every conversation on every HF band and really cares about what is said on HF. As one that actually works HF, I can assure you they don't, nor do they care. Considering some of the vulgarity that occurs, it's true that occasionally someone finally gets caught, but the odds are far greater that you'll get caught speeding than getting a notice from the FCC. Since the FCC plans to close the majority of their field offices soon, I'm afraid the situation will get even worse in the future.

For those that haven't read Bruce's various mistakes before, he tends to express his views (perfectly acceptable BTW) but doesn't like it one bit when anyone corrects his many mistakes. His issue with me started back when he went on and on about how the CW operators on the Titanic were sending out "SOS" but sadly weren't in range to be heard (because he saw that info on a TV show). I pointed out that the operators were actually sending "CQD" (come quick distress) and not "SOS" (since "SOS" had not been established yet as the preferred distress call on CW), and provided him a link to the actual testimony of the wireless operators from the Titanic. It's actually interesting reading (if you are both a history buff and a ham). You can google the info for yourself if interested.

Apparently that was all that Bruce needed to decide that I was picking on him and he'd block my postings because he had just discovered the ability to do that. So to prevent all of the rest of you from being blocked by Bruce (insert laughter here), be sure to not correct him (ever) when he makes a mistake (often). I'll just have to learn to live with it (LOL).

On a day we honor those who gave their lives so we have freedoms, including the right to vote. For a person to say just because they may not know the name of the USB port, or maybe they tried to insert the wrong way... they shouldn’t vote.... is just plain wrong. This is only one instance out of many that he enjoys degrading others.

I work in the telecommunications industry, including providing dialtone to customers. Would it be nice or correct of me to say, just because they think it’s the telephone lines entering their home is at fault that causes their cordless phone not to work, while their corded phone does... should I say.... they should be sterilized?

There are several people on this list that take advantage of no owner taking active moderation on this list, which is sad. New people see the few people who take joy in abusing others and leave. I operate UHF and VHF repeaters only. Not one repeater owner would allow this person to talk like this on the airwaves, using their repeater. Who would?

He and others are breaking Yahoo’s terms of service, and their own Internet Service Providers TOS too.

Bruce

Here they buy the cheapest uv5R ever offered and come to me with 10 people at our tables and want me to drop everything and program it for free for them.

They are getting more tricky though, like peeling off the labels to get us to program a radio we do not sell but getting a free program after claiming reset all was pushed.

I am waiting for someone to start jamming the police/fire using these radios. Some of these people are retards for sure.

This is the typical repeater here

http://www.broadcastify.com/listen/feed/14747/web

listen when the drunks are out.

The problem with this Mike, is that the first few times you are helping and teaching. The next 20+ times it gets old. This gets VERY old if you’re a dealer like Craig is and you get people calling you with problems and tech support 24/7 for products they bought elsewhere. Craig should practice talking to them in a incoherent accented Indian (India) call center accent. I have one guy call me at least a few times a week asking me the exact same questions- many examples like this.

This happens a lot, I give out a large amount of info, let people look at the radios and explain everything until I lose my voice and end up with a headache at the end of the day. These types will STILL go buy somewhere else to save $5 (I preprogram mine) and show up trying to get you to fix a problem.

Once you start this you end up on the hook for life and some of the biggest retards will demand free help once you helped them or blame you for not following instructions.

I have had people show up at shows with 10 people at the table demanding I fix their computer because I told them to go to Miklor and follow instructions to install Chirp/drivers (because they are too cheap to buy RTS)

They cannot follow Miklor’s instructions and claimed Chirp was a virus.

Multiple this by dozens of phone calls all day long .. and you can see after months of this you start being selective to whom you’re going to help. Some are drunk on hunting or camping trips wanting help late at night.

Some people should not have a radio ,drive a car , operate a computer. I never believed this until I started selling them. You isolate yourself from the real bottom rung people, like most of us do. It is eye opening when you deal with the general public.

Maybe I am being too harsh but as a whole has our population become more stupid since we grew up or is this just my observation. I think some of them have problems with addiction, mental illness or other reasons for being this way. is there variants of dementia starting earlier in some of the age groups due to pollution, food chain or other factors?

Something is going on as I cannot remember it being this bad, something most likely has changed , at least in the USA.

Art is a reflection of culture, look what is on TV, what music is coming out, who gets elected to our government- Radios are no different we should sell a “Dancing with the Stars or a Kardashian model” maybe that would be popular and boost sales.

From one Bruce to another:

As a Vietnam veteran who - on this Memorial day - is saddened as I remember my friends lost in that war (some who have never been returned except for pieces of bone - Google Cap 72 for more information) I am offended that you would bring this day into your disagreement over USB port knowledge. I too have worked providing dial tones to customers (PBXs for the most part) and have not made judgement about peoples knowledge. In fact I agree with your point of view but am offended that you brought Memorial day into your argument.

Instead take a moment to remember our lost Americans,

Bruce (KU1Y)

Craig did help though, the problem is getting dozens of these calls a day or respective ones. The worst ones are these where they end up to be time consuming and Craig is not RTS. RTS has their own tech support.

I am sure Craig’s policy is the same as ours , “You support the customers and products you sell.” However, I get calls to give tech support from people who never bought anything from us.

To keep from being frustrated- and a good stress release we can only laugh and retell some of the funnier stories like this. This is how I cope with it. This is a funny story to share, some are not funny though when drunks and gang members either steal off the tables or demand something from you in not such a polite way.

The harmless USB story sure beats the story where we had to call security from someone grabbing stuff off tables and pulling a knife on someone.

I think we are in the majority, Bruce, but I do have to sympathize with Craig a bit. I work on computers for a living and it is extremely disheartening to hear this kind of response from a user in 2015, particularly if this person bought the programming cable. This is the information age. With the amount of knowledge on the internet and all the videos and pages that exist for programming these radios there's really not much of a reason to have this kind of repeated question.

That being said it really isn't in the spirit of hams to not be helpful in a meaningful way. Instruct the person how to connect the cable and maybe give a bit more input, like what search term you should use to get info on programming the site. At least pass on miklor.com. I'm pretty sure we all started there. I know I did.

I am trying to program a radio for a friend. When using the Chirp software I have the correct com port and radio selected. When I try to read from the radio I get a message saying incorrect radio selected. The only difference I see is that this radio has a longer battery. I tried selecting other radios from the list but none worked. Any suggestions?

Depends on how much transmitting in that half hour QSO.

The manual shows the duty cycle to be 03/03/54 RX/TX/Standby.

You may be exceeding the intended duty cycle.

Does anyone else find their antenna gets HOT about an inch-and-a-half up from the base, during transmit?
…..
But although the rig receives and transmits just as well as any other HT with a regular-sized rubber duckie antenna, I notice that both of my antennas become really hot after about half and hour of QSO.
…….
Any comments would be appreciated.

When visiting the family section of the cemetery to visit relatives who has passed on, there is a grave of my mothers cousin who was blown up in his tank, he fought and died under Gen Patton. All my fathers brothers fought in WW2, my father fought in Korea. Yes, I know the price of freedom is not free. I am offended when someone believes certain people have no right to vote when I have family members who died protecting our freedoms. Enough said about this topic.

Same directions as any split channel.

#1 Enter rx frequency

#2 Menu 27 - pick channel and Menu again to save

#3 Enter 2nd freq

#4 Menu 27 - save again for tx freq

Hi Chuck,

CHIRP recognized one of them and not the other so there is definitely
a difference between them. It would help if you would share with us
the models that you are trying to program.

There are only two things that can cause this error.

1. Selecting a different model that than the model that you trying to
program. For example selecting UV-5R for a radio with 3 power levels
when BF-F8HP should be the model chosen.

2. The model's firmware version isn't recognized by CHIRP. In this
case, make sure you are using the latest daily build of CHIRP. New
firmware detections were recently added.

In any case, the debug.log file generated by CHIRP will give more
detail as to what it is that it doesn't like/understand.

The CHIRP website documentation tells you how to find your debug.log file.

From: Jim Unroe
Topic: 50312 Message: 50313

It is a UV-5R. The seller bought a sufficient number of radios that a custom badge with I6+ printed on it. Since the I6+ is presumably unique to this seller, this seller can have the radio fulfilled by Amazon without worrying about Amazon mixing the inventory with or seller's UV-5R inventory. Otherwise it is just your run-of-the-mill UV-5R.

Also note that the Amazon page lists the UHF frequency range as 400-480 MHz. These radios have been 400-520 MHz for over 2 years. That tends to make me not believe anything else the vendor may say about the radio this radio being "better".

Firmware version for firmware version, all of these radios have pretty much the same electronics so the only difference then would be the case and sometimes the antenna. This radio looks like it comes with the A-5R logo antenna which is know to be poor performing.

As has already been suggested, you probably need to be using the latest Chirp daily build to access the most recent models with Chirp.

One alternative may be to use BaoFeng's own software which is easier to use and less dependent on the precise firmware version because the software works differently.

Apparently BaoFeng's new firmware has changed the manual programming process, so if the radio has very recent software, it may not be possible to program such a cross-band split manually. However it is easy enough to program the two frequencies as separate simplex channels then bring up one in each of the two displays with dual watch turned on. This would let him listen to one channel and transmit on the other. It isn't 100% what he wants, but it comes quite close.

Find a non-digital trunking scanner thatcovers aircraft and use that instead. Itwill pick that up better and scan and morereliably then any '5R variant. Use Radioreference to check a unit before buying it.
Enter the model number in the search box
in the upper right corner of http://www.radioreference.com/to make sure the unit you're looking at covers aircraft.
Many old non-digital trunktrackers are being sold cheap.

==
Have (many) scanners, do listen.

I dont have my UV-5R yet, but am wondering if setting the wide/narrow filter and then experimenting with a small frequency offset might not help the FM discriminator to optimize the audio on a specific tower frequency.

Yaesu FTDX-9000
It comes with the manuals and original shipping boxes.
Very clean rig with no issues, includes manual, keypad, keyboard, and hand microphone.
I have the original shipping box.
Price: $5800.

Icom IC-7800 w/SP-20 Speaker
Icom IC-7800 Rev. 2 with 15, 6 and 3 kHz Roofingfilters and the latest 3.10 firmware installed.
Included is the matchingSP-20 Speaker.
Supplied accessories include printed Factory IC-7800 instruction manual &2013 color instruction manual complete with firmware updates, AC power cable, Antennajumper cables, Rack mounting handles & screws, Compact Flash memory card, 1-pairfront stands, and Main dial.
Radio will be shipped in the original factory double box with speaker packed..
Price: $4050

Icom IC-756 Pro3.
I have the manual, the schematics, a bag of fuses, the 1/4 inch CW plug, the power cable and the hand mic. Bagged in original bag, in the original foam, and in the original box.
I will include the SM-20 desk microphone and the SP-21 speaker.
Price: $1450

I am downsizing station.

Plus I will add to get model labels printed up or a special different case to look different, adds about $10-20 extra on the price depending on the number originally ordered.

That is possibly why the $10 extra.

Subject: Re: [baofeng_uv5r] UV-5R vs, UV-5R I6+

It is a UV-5R. The seller bought a sufficient number of radios that a custom badge with I6+ printed on it. Since the I6+ is presumably unique to this seller, this seller can have the radio fulfilled by Amazon without worrying about Amazon mixing the inventory with or seller's UV-5R inventory. Otherwise it is just your run-of-the-mill UV-5R.

Also note that the Amazon page lists the UHF frequency range as 400-480 MHz. These radios have been 400-520 MHz for over 2 years. That tends to make me not believe anything else the vendor may say about the radio this radio being "better".

Firmware version for firmware version, all of these radios have pretty much the same electronics so the only difference then would be the case and sometimes the antenna. This radio looks like it comes with the A-5R logo antenna which is know to be poor performing.

I would just buy something like the 3318 uv E model that is a Tri-band with Airband rx in it. You get 70cm/2m/1.25m bands and AB + FM in the SW band.

Prices are not much higher than a HP version.

199 channels with other bells and whistles too.

The UV-5R is a one-chip SDR transceiver. It doesn't have a real FM receiver. There is no IF filter or discriminator. All that is done in software. The wide/narrow setting only increases the receiver audio in narrow mode.

If the problem is actually in the firmware, you won't be able to "fix-it" (unless you count on just sending them back as a fix).

From: Mike Lubrecht
Topic: 50261 Message: 50330

I recently read an article that described the huge monetary hit that major businesses are taking in (re)training new employees to use basic office automation, like Windows and Microsoft Office. It seems that the current crop of young people, high school through recent college graduate, are very proficient in using social media on their smart phones but a sad percentage are woefully inadequate in computer skills of any sort. This surprised me greatly, considering the constant discussion of how kids need to be taught those very skills in school.

So - perhaps it shouldn't be a surprise that a newbie doesn't know what a USB port is.

BTW - this is my first post to the group. Great group and very informative - I've found a few tidbits of useful information here that made programming and accessorizing my stable of UV-5Rs and my BF-F8HP. Even soldered the jumper on one of my 5Rs to fix the no-audio problem, following a link I learned here.

It is worth delving inside...

The cost of a new volume control makes it uneconomical, but that on-off switch is hardware, and if you are lucky, it could be a solder "splash" across the switch contacts. There is no firmware involved for switching, just those contacts, which is why a charged battery stays that way if the '5R is left off...

Of course, if the control does not "click" into the off position, don't even bother to take it apart, as it would need a new control.

Good luck,

50333. UV-5R doesn't display 7 characters in channel name

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-27 15:14:41 UTC
From: anastasio_sb@...
Topic: 50333 Message: 50333

Hi group!
I've just received a new UV-5R and after programming it with CHIRP it doesn't display all 7 characters. It is version 150304N. It is not apparently a CHIRP or programming problem as I have another older one (version 141006N) which displays properly 7 characters in display.

Another test I've done: after upload to radio, I can download the data and downloaded data still display 7 characters in the channel names in CHIRP.

Do you guys know if some last firmware versions are cutting the display?.

Thanks in advance and BR.

Okay on the Anytone model, I had never heard of that brand. It is a shame uv5r does not have AM, which is on my must have list with an airport nearby. There is a u-tube video showing some decent results using uv5r for AM mode but I am considering now that it must be faked. I have some radios that will pass some good audio from AM transmissions in FM mode but not likely this one. If it's all in software it may be added on a future model. Thanks for all the input - de wb8yqj...

They are completely sold out , even at the factory level (checked last night) will be avail in a month or so.

AM I set in a subchannel group for all the air freqs here- still learning I do not have another to test the freq hopping secure text message function. The tri-band capability is great plenty of channel space 199 and I set a scan bank for just public service freqs. Scan rate is very fast almost like a real scanner.

On the LW band I was able to pick up some things around 25 mhz, some birdies and data pings too bad not a SSB capability here.

Interesting unit for something under $100

I've heard this somewhere else that on the latest firmware versions that the 7th character will no longer display. CHIRP can't make a radio do something it can't do. CHIRP programmed 7 characters because the radio was capable of 7 characters. Baofeng can change this to 6 characters without affecting their software because their software has always only supported 6 characters.

Since I normally use RT Systems to program everything I can, I haven't noticed any Baofeng radios with only 6 character displays, Jim, but I'll keep an eye out and post it here if I see any.

Craig,

Confirmed...

I've got a radio here that was loaned to me for testing. It has
N5R-219 firmware (141006N). I can write 7 characters to the radio and
read 7 characters back, but it will only display 6 characters of the 7
character channel names.

Their are two possibilities that I can see that can cause what is occurring in the video.

- Many Broadcast stations link their studios to the transmitter site via microwave or short haul links. Possibly this is a station to station link.

- The other possibility has to do with the frequency. 467.7125 MHz is an FM FRS channel. Is it possible someone is rebroadcasting their AM radio to another 'Walkie Talkie' ?

An AM signal on 729kHz being heard on UHF FM doesn't compute.

That would be an obvious natural broadcast link on FM UHF. The video I watched for AM aircraft was this one - at this point I would not believe it unless I saw it myself.

The video is way out of focus but the radio seems to be tuned to the very high end of the voice half of the Airband. In Australia I suspect we would be unlikely to find any traffic up there. I have vague recollections of posts a year or so ago that suggested that some US airports actually have some FM channels, in addition to normal AM frequencies?

The audio also appears heavily distorted, at least to my ears.

50352. Re: HOT Antenna

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-28 03:18:39 UTC
From: blunder@...
Topic: 50271 Message: 50352

Hi Paul,,
Better late than never - well, sometimes anyway...!!!

I was chasing another thread in this group a few moments ago and spied the words "Hot Antenna" and I thought "I know of only one person mentioning that on 6625,, Paul (4AX)", so I opened the thread and lo and behold it WAS you...

I'm not 100 percent sure of the other replies regarding this issue but if you have the smaller antenna, approx 4+1/2" (120mm) long, with 4 rings around the base and one recessed ring about 5mm from the tip,, then this is most likely the wost of the Baofeng H/H antennas. It is known to break internally resulting in intermittent transmission and receive sometimes, while other times the breakage isn't a problem or even noticed at all. That antenna is quite rigid and bending and twisting it all the time increases the chances of breaking the capacitor leg inside the antenna actual.. I saw a video of how to repair this if it does break, on YouTube but I can't seem to find it now - not saying that yours has this problem but who knows..?? You just take off the sticker up inside the antenna base, undo the nut, and somehow pull the guts out to reveal the area/capacitor of concern. Perhaps replacing it with a better quality or slightly different type of capacitor might even make it run cooler. Who knows just what they have used in there..!!

Yours certainly sounds ok, as I hear you many times TX'ing with it. If I am home, I'm usually listening in on the National Link, 6625, Waikato and Bombay repeaters all at once.. I seldom reply or TX myself unless I have a reason to but I love listening in...

Of my two 5R's, one "had" the small antenna I described above and the other had a larger one usually found models like the UV-82, and this antenna seems to be much better - a bit more gain and certainly a lot more flexible. The one I use mostly, has an Icom dual band antenna adapted to it and seems to work well... I've never had a heating issues with mine but then again, I don't TX anywhere near as often or as long as you do,, and I only use low power..

It's a bit worrying when you see how many of these radios are being sold on TM and I wonder just how many of them have been bought by unlicensed people. Where I bought my second one, he was selling them to anyone, so I told him he could/would get in deep trouble if he gets caught selling to the unlicensed guys. He didn't even know the law as regards to this type of radio. Just "money" to him, although he did modify his advert on TM after that, however I still see UV-5R's being sold by others even as scanners etc.. Worrying..!! No wonder there's so much Tomfoolery on the local repeaters and the National Link, as I have heard many CB'ers talking about their UV-5R's in the recent past.. 1 plus 1 equals 2 doesn't it...!!!

Hope you sort out your worries... See you back on 6625 at some time...

Al... (ZL1VSF)

Does anyone else find their antenna gets HOT about an inch-and-a-half up from the base, during transmit?
Apologies if this has been answered on the group before, but I'm new here and this is my first posting. I've checked through the messages but didn't find anything.

I've had my two new UV5-R camouflage radios for about a month. I've got all the accessories and lots of spare batteries. Great.
But although the rig receives and transmits just as well as any other HT with a regular-sized rubber duckie antenna, I notice that both of my antennas become really hot after about half and hour of QSO.
The rubber becomes so hot that it's hard to hold your finger on it for long, and you can feel the warmth radiating against your face. The heat is localised in a small area about an inch-and-a-half up the antenna. After a while it spreads a little, but never gets as far down as the radio itself. (at first, I mistakenly assumed that the heat was coming upwards from the radio's heat sink under the antenna socket, but it isn't. That stays much cooler).

Obviously, it's wasting a huge amount of power and battery efficiency in heating-up the antenna, when that energy should all be getting radiated as RF signal.

So please, has any reader experienced the same thing? And has anyone found a good replacement rubber duckie antenna made by one of the good brands? Maybe there's an antenna from a Yaesu or Kenwood model that will fit? I want something that is the same size as the original, and all rubber, not an extended one with a hard coil at the bottom and a long whip like the Nagoyas I'm seeing for sale.

Any comments would be appreciated.
73 Paul ZL4AX New Zealand

Well this does exactly what I have experienced next to an airport. You get strong AM channels coming in through the FM processing. You can also transmit too with a huge DB loss at the filter edges but it is still FM

Even my Chinese clone ZT 2R (VX 2R yaesu clone) will transmit at 118 mhz but FM only.

However it DOES RX in AM those AB freqs.

I would get a AB capable (AM RX) radio instead as the uv5R clones are very poor at the band edges and are not made for RX AM. Just wait till thec 3318's come out or get a ZT 2R if you want AB stuff.

I listen to SO CAL approach and Police Helo activity on my ZT2R

From: Campos Vazquez camposvazquez@... [baofeng_uv5r]
> can other A.M. channels be listened to in the same manner?

Sure. Any AM channel that you monitor on another radio, and retransmit with an FRS HT can be easily received on the UV-5R exactly the same why the guy faked it on U-tube.

> is there a formula for converting A.M. channels into UHF? then putting
> that frequency into the uv5r?

Yes, Pick any seven numbers and key them in. Then tell people that you are receiving AM signals -- but be sure that you have the other channel on your radio set to match the frequency you are retransmitting the audio from another radio on.

> i am only using the uv5r as a walkie talkie on MURS,

> and receiving at the low power setting of 1 watt with
> the addition of a tiger tail.

You should look up the firmware mod to let your UV5R transmit at 50 watts.

This email has been checked for viruses by Avast antivirus software.

No. I'm not sure what was happening there, but it wasn't the UV5 picking up the MW signal.

Most likely was that as John said, someone else was using that frequency to relay the broadcast.

Theoretically any modulation would contain some percentage of other modulations.
like FM would have some AM content an AM would also have FM

But in reality , we cant perhaps expect to receive Shortwave AM broadcasts or even am aircraft band signals on FM mode properly.

i do hear the repeater Morse that is FM on am mode using my rtl sdr.
. because it is Morse , I could perhaps manage.

50363. Re: UV-5R doesn't display 7 characters in channel name

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-28 16:43:01 UTC
From: anastasio_sb@...
Topic: 50333 Message: 50363

Craig,
Are you sure about the version?. As I stated in my first message my older uv5r is 141006N and I can display all 7 characters, although newest one (150304N) can't.
One hint: use last daily build from chirp. I did it and it's working for 141006N.
By the way, this makes me think that firmware could not be the only cause of the problem and depending on the version of chirp some problem could be arising. Any ideas? Some way to trace or extract a detailed log?
Thanks again.

John,

You should be able to see any Alpha-Numeric name you've given the memory if Menu 21 (for VFO A) and/or Menu 22 (for VFO B) is set to Name. Many folks will set Menu 21 to Name, and leave Menu 22 set to FREQ, that way you can simply match up whatever you have in memory 7 in VFO A (for example) to memory 7 in VFO B to see the frequency of whatever is in memory 7.

Perhaps someday Baofeng will adopt Wouxun's method of using the VFO/MR button (to display the frequency underneath the named memory), but for now this will work.

Don't feel too bad. I've probably got 20-25 HT's and they all have their quirks. It's hard to beat the Baofeng's (based on price only), but many of the other Chinese brands have features that I like more, so it's all a matter of budget and what you're willing to pay to get what you want. Sometimes it's hard to explain your "favorites" - they just are.

Even when tuned to the top edge of the aircraft band, I doubt that the UV-5R RF output is actually strong enough to be dangerous, but if it was even noticed at all the result would be a visit my a couple of men in suits carrying badges. The FCC doesn't really make any serious attempts at enforcement in most radio services, but they do respond to complaints from other government agencies, especially when those complaints are about wanton endangerment - which is what transmitting anywhere on the aircraft band is.

As I said, I doubt that the UV5R would put out a strong enough signal to be noticed unless you were at or next door to the airport, but its FM signal would provide a steady carrier that could easily be traced once anyone noticed that it was there at all. Of course, add a decent antenna and that's a whole new ball game.

craig,

are there other inexpensive ht's like the uv5r with the massive online support.

do they have Yahoo groups well.

i am really enjoying this new hobby.

i used the for the walkie talkie function.. i volunteer at a local shelter that caters to veterans..

these radios have been indispensable. .. we use bubble packs.. i lend one of my uv5r radios to our coordinator. i programmed the frs channels on the uv5r .. at 1 watt every can hear her tx... on there .25w bubble packs she cant hear the other volunteers very well.

its been awesome to contribute... i will inquire about the shelter acquiring a license to use these radios.

i am contemplating on buying more ht uv5r radios and donating them to the shelter.

i am sold on the uv5r' s but if theres other ht's out there that are more robust and inexpensive...i would like to know about them.

thank you for your informative posts.

Seriously, I've wondered about using Bluetooth vox headsets. Aren't they also a violation (using a non-licensed radio to talk through a licensed one).

I don't think you have to worry about enforcement though. The FCC isn't interested.

Ron,

I respectfully disagree. There are exceptions. So your statement "This is true for whatever frequencies and Services you are listening!" is incorrect. See the particular rule quoted below.

§ 97.113 Prohibited transmissions

(c) No station shall retransmit programs or signals emanating from any type of radio station other than an amateur station, except propagation and weather forecast information intended for use by the general public and originated from United States Government stations, and communications, including incidental music, originating on United States Government frequencies between a manned spacecraft and its associated Earth stations. Prior approval for manned spacecraft communications retransmissions must be obtained from the National Aeronautics and Space Administration. Such retransmissions must be for the exclusive use of amateur radio operators. Propagation, weather forecasts, and manned spacecraft communications retransmissions may not be conducted on a regular basis, but only occasionally, as an incident of normal amateur radio communications.

This has been discussed before.
If I remember, you can use a Bluetooth device with your radio, and here is why: Bluetooth is rated to only transmit at, up to, 300 ft. BUT must devices only transmit/receive at 30ft, because of security issues. Bluetooth is a digital device that is rated at 384 Kilobits and uses a PIN Code to Pair two devices together.
IF what you say is true, then I shouldn't be able to use the Bluetooth on my laptop to connect to my Bluetooth wireless headset to listen to streaming audio/video, (Even if I use a DVD, it is still being broadcast via the Bluetooth.), while I am using the wireless network to access my wireless router.
I think what the rules state for the purpose of using a two-way radio and hooking up to another two-way radio. CB'ers used to do that. Hook up a base station to another, and then have someone at another location transmit into that and effectively double their range, while not using a repeater.
Back in the late 70's, there was a crook that did that with some CB Radios (something about a ransom, somewhere in the Northwest. Seattle comes to mind.) He was using them to throw off the authorities to his true location. But they found him anyway.
Another scenario comes to mind; connecting a AM/FM Radio to a base station. Now, the AM/FM would be a SERVICE, since that is commercial radio.
Now, you listed the FCC Rule, but it specifically says SERVICE. Bluetooth has been around for the past 15 years. Bluetooth is not a SERVICE. Since it only allows communication between the host and the device in question, using a PIN Code, to Pair the two together. Bluetooth does not allow for multiple connections. You have to unpair the device, headset/stereo headphones/mouse so that it can be paired to another host.
But, some of you say, "Well, I have several Bluetooth devices listed on my computer/laptop." That is true. Your Bluetooth on that computer/laptop is the host. But when you 'pair' a Bluetooth device to your computer/laptop you are using it exclusively to your computer/laptop, and no one else can use that device. If it didn't, then other people could hear what you are listening to when you are using your phone, or listening to streaming audio/video from your laptop. Same would hold true for a Bluetooth VOX Device. It would be paired to the headset/microphone and it would not be transmitting blindly to all the Bluetooth headsets out there. (You probably could hack the host device that plugs into the radio, but what good would that do? You want to hook a mouse and keyboard to the radio?)
Now, I am not a Ham, yet. But have been working on my license on and off for the last 10 years. But I have been in IT for the past 35 years. The question I would like answered is this: When has Ham Transmissions, regardless of the frequency, been considered a SERVICE?
Could you, please, define SERVICE?

It wasn't the strengthy of the signal that I was labelling potentially dangerous but the mere fact that it was made at all, potentially diverting attention by pilots and controllers from the real tasks at hand, triggering possible search and rescue efforts etc. Put simply, if you have no legitimate reason to tx on the Airband, don't! It is there to provide a safety service for aircraft, no other reason.

50378. uv5r overridden

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-28 23:47:56 UTC
From: Marty Braun
Topic: 50378 Message: 50378

Greetings all:
Marty here. KC3AID. I have had a uv5r for about 2 years. No complaints. I actually like it better than some of my friends' more expensive HTs. It's a great little radio. Until now. And even now the radio is still good. But it has become a victim of severe government interference.
No. This is not some paranoid conspiracy theory. It is a cold hard fact. Seems DHS is experimenting with aerial radar platforms mounted on tethered aerostats. One of these systems is being floated at Aberdeen Proving Grounds, just a bit northeast of Baltimore MD, USA. I live on the northeast corner on Baltimore. I can see the system by looking out my kitchen window. And I can hear it for miles around across the entire 2 meter band on my uv5r. I have heard it from as far west as the Howard County Fairgrounds. I have not heard it from my vacation spot in Hardy Count WV.
Better radios seem to be unaffected by the interference. Yes. I understand about our front ends. A friend has an Anytone mobile unit, not sure of the model, that suffers the same symptoms. But I can hold my Baofeng side by side with a Yeasu FT 60, and the Yeasu will hear the band just fine while all my Baofeng hears is a sound similar to horns blowing. It is basically unusable on the 2 meter band, while the 70 cm band is still fine. Friends with Icoms and Kenwwoods are getting along just fine. Guess it is a case of getting what you pay for.
So, unfortunataely, if you live in the Baltimore area and are looking for a uv5r, I respectfully suggest you look for a better radio. At least as far as the 2 meter section goes.
I also suspect this post will start a conversation on this group, which I look forward to following. I am surprised it has not been written about sooner. Hmm. Since it affects other radios too, maybe it will be time to start a Yahoo Aerostat interference group where we can discuss the effects and performances of various radios in this vicinity. I know there are other aerostats carrying similar systems in other parts of the U. S. I wonder if others are having these problems.

Concerning Bluetooth devices, they all don’t use pin codes, or use default pin codes like 0000 or 1234. I just paired a Bluetooth ear piece, didn’t ask me for pin codes at all. I also just paired a Bluetooth Keyboard to a tablet. To pair the two, the tablet had me enter a code on the keyboard to pair it. The problem with pin codes for Bluetooth devices that are unique is this. I have a small Bluetooth printer. It had a unique pin code to help pair it to my smart phone. Every time I try and pair it to a new device, I have to do a internet search to find the non default pin code associated with the device.

I have a Bluetooth speaker that I use with my laptop, no pin codes. I just set it up in search mode and my laptop finds it and connects to it.

Subject: Re: [baofeng_uv5r] Note to users and abusers

This has been discussed before.

If I remember, you can use a Bluetooth device with your radio, and here is why: Bluetooth is rated to only transmit at, up to, 300 ft. BUT must devices only transmit/receive at 30ft, because of security issues. Bluetooth is a digital device that is rated at 384 Kilobits and uses a PIN Code to Pair two devices together.

IF what you say is true, then I shouldn't be able to use the Bluetooth on my laptop to connect to my Bluetooth wireless headset to listen to streaming audio/video, (Even if I use a DVD, it is still being broadcast via the Bluetooth.), while I am using the wireless network to access my wireless router.

I think what the rules state for the purpose of using a two-way radio and hooking up to another two-way radio. CB'ers used to do that. Hook up a base station to another, and then have someone at another location transmit into that and effectively double their range, while not using a repeater.

Back in the late 70's, there was a crook that did that with some CB Radios (something about a ransom, somewhere in the Northwest. Seattle comes to mind.) He was using them to throw off the authorities to his true location. But they found him anyway.

Another scenario comes to mind; connecting a AM/FM Radio to a base station. Now, the AM/FM would be a SERVICE, since that is commercial radio.

Now, you listed the FCC Rule, but it specifically says SERVICE. Bluetooth has been around for the past 15 years. Bluetooth is not a SERVICE. Since it only allows communication between the host and the device in question, using a PIN Code, to Pair the two together. Bluetooth does not allow for multiple connections. You have to unpair the device, headset/stereo headphones/mouse so that it can be paired to another host.

But, some of you say, "Well, I have several Bluetooth devices listed on my computer/laptop." That is true. Your Bluetooth on that computer/laptop is the host. But when you 'pair' a Bluetooth device to your computer/laptop you are using it exclusively to your computer/laptop, and no one else can use that device. If it didn't, then other people could hear what you are listening to when you are using your phone, or listening to streaming audio/video from your laptop. Same would hold true for a Bluetooth VOX Device. It would be paired to the headset/microphone and it would not be transmitting blindly to all the Bluetooth headsets out there. (You probably could hack the host device that plugs into the radio, but what good would that do? You want to hook a mouse and keyboard to the radio?)

Now, I am not a Ham, yet. But have been working on my license on and off for the last 10 years. But I have been in IT for the past 35 years. The question I would like answered is this: When has Ham Transmissions, regardless of the frequency, been considered a SERVICE? Could you, please, define SERVICE?

Seriously, I've wondered about using Bluetooth vox headsets. Aren't they also a violation (using a non-licensed radio to talk through a licensed one).

I don't think you have to worry about enforcement though. The FCC isn't interested.

Greetings all:
  Marty here. KC3AID. I have had a uv5r for about 2 years. No complaints. I actually like it better than some of my friends' more expensive HTs. It's a great little radio. Until now. And even now the radio is still good. But it has become a victim of severe government interference.
  No. This is not some paranoid conspiracy theory. It is a cold hard fact. Seems DHS is experimenting with aerial radar platforms mounted on tethered aerostats. One of these systems is being floated at Aberdeen Proving Grounds, just a bit northeast of Baltimore MD, USA. I live on the northeast corner on Baltimore. I can see the system by looking out my kitchen window. And I can hear it for miles around across the entire 2 meter band on my uv5r. I have heard it from as far west as the Howard County Fairgrounds. I have not heard it from my vacation spot in Hardy Count WV.
  Better radios seem to be unaffected by the interference. Yes. I understand about our front ends. A friend has an Anytone mobile unit, not sure of the model, that suffers the same symptoms. But I can hold my Baofeng side by side with a Yeasu FT 60, and the Yeasu will hear the band just fine while all my Baofeng hears is a sound similar to horns blowing. It is basically unusable on the 2 meter band, while the 70 cm band is still fine. Friends with Icoms and Kenwwoods are getting along just fine. Guess it is a case of getting what you pay for.
  So, unfortunataely, if you live in the Baltimore area and are looking for a uv5r, I respectfully suggest you look for a better radio. At least as far as the 2 meter section goes.
  I also suspect this post will start a conversation on this group, which I look forward to

following. I am surprised it has not been written about sooner. Hmm. Since it affects other radios too, maybe it will be time to start a Yahoo Aerostat interference group where we can discuss the effects and performances of various radios in this vicinity. I know there are other aerostats carrying similar systems in other parts of the U. S. I wonder if others are having these problems.

For the UHF only band check out the Baofeng BF888s. They are in the 14 to 20 dollar range. By shopping I paid $13.78 each for six, free shipping on Ebay. Excellent 16 channel radio using the same system as the UV-5R but very, very basic fool proof units with few controls. Perfect for non- trained operators.
For hams it allows rubber duck monitoring or operating on UHF Ham Channels/repeaters darn near free. A very capable, amazing HT for the money.
Like the UV-5R, they are "SDR" (Software Designed Radio) and very easy to overload with other off frequency, strong radio signals. Usually not a problem with small antenna's.
But. They must be programed on a computer. They supply the program.
No comment on the legality of using them except as a FCC licensed "ham" in Amateur radio Service. But if you're using the UV-5R now, I doubt if you are too worried about that.

Very good point, Jardy.

A few years ago we had a neighborhood watch group in the Phoenix metro area get some ham radios that had been programmed for various repeaters and VHF simplex use. Of course, those users were very happy that their "new" radios had much greater range that their previous Radio Shack units.

A few weeks later it was revealed that several hams in the area had located their illegal use of the radios on ham simplex frequencies (and their physical location). Several members of that watch group tried to explain to the more militant folks (within the group) that it would be a good idea to stop using those radios without a proper amateur radio license.

Most did stop, several didn't and about a month later they made the newspaper again. They complained long and loud about how they had a "right" to use the radios (however they felt necessary) but the FCC folks felt otherwise and they were cited. I never did hear how much, but I'm sure it wasn't free.

From: Jardy Dawson
Topic: 50333 Message: 50386

Those radios are probably Part 90 and Part 97 ok. Part 90 requires an Agency license, Part 97 requires individual ham licenses and no money making for the users involved, meaning they cannot be paid while using them, very little exceptions involved. Those radios cannot do MURS (vhf) and are not legal on GMRS or FRS. An agency using these radios can face big fines, up to $11,000.00. For a non-profit, that can put them out of business in a hurry. Is it worth taking the chance? And even though they may be non-profit, doesn't necessarily mean everyone is working for free. This type of communications can not be qualified as 'emergency' where the rules do not apply.

Very good point, Jardy.

A few years ago we had a neighborhood watch group in the Phoenix metro area get some ham radios that had been programmed for various repeaters and VHF simplex use. Of course, those users were very happy that their "new" radios had much greater range that their previous Radio Shack units.

A few weeks later it was revealed that several hams in the area had located their illegal use of the radios on ham simplex frequencies (and their physical location). Several members of that watch group tried to explain to the more militant folks (within the group) that it would be a good idea to stop using those radios without a proper amateur radio license.

Most did stop, several didn't and about a month later they made the newspaper again. They complained long and loud about how they had a "right" to use the radios (however they felt necessary) but the FCC folks felt otherwise and they were cited. I never did hear how much, but I'm sure it wasn't free.

thank you Kenneth.
the tradition i didn't consider ther bf888 wad they issue of so many of them being returned by members ogf this Yahoo group. i assumed out was from poor performance?
if the bf888 can be programmed to store murs/ frs/gmrs channels and at least tx..rx.. at 1 watt i am sold.
i will read up on the bf888 more. that price of under $20 is perfect for my budget. i can definitely outfit every volunteer at the shelter with a radio and a couple to spare for backup.
On May 28, 2015 5:48 PM, "Kenneth Meade wa6ivd@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

For the UHF only band check out the Baofeng BF888s. They are in the 14 to 20 dollar range. By shopping I paid $13.78 each for six, free shipping on Ebay. Excellent 16 channel radio using the same system as the UV-5R but very, very basic fool proof units with few controls. Perfect for non- trained operators.

For hams it allows rubber duck monitoring or operating on UHF Ham Channels/repeaters darn near free. A very capable, amazing HT for the money.

Like the UV-5R, they are "SDR" (Software Designed Radio) and very easy to overload with other off frequency, strong radio signals. Usually not a problem with small antenna's.

But. They must be programed on a computer. They supply the program.

No comment on the legality of using them except as a FCC licensed "ham" in Amateur radio Service. But if you're using the UV-5R now, I doubt if you are too worried about that.

Better get a copy of the FFC Regs. "IT IS ILLEGAL TO REBROADCAST SIGNALS FROM ANOTHER SERVICE"! This is true for whatever frequencies and Services you are listening! If you are a Licensed Ham Radio Op, YOU WILL LOOSE YOUR LICENSE, a hefty fine and maybe even some time in prison! A word to the wise, DON'T DO IT!
Ron K1VSC

Certified Trainer and Examiner

You are referring to (and misquoting) 97.113 subparagraph (c):
(c) No station shall retransmit programs or signals emanating from any type of radio station other than an amateur station, except propagation and weather forecast information intended for use by the general public and originated from United States Government stations, and communications, including incidental music, originating on United States Government frequencies between a manned spacecraft and its associated Earth stations. Prior approval for manned spacecraft communications retransmissions must be obtained from the National Aeronautics and Space Administration. Such retransmissions must be for the exclusive use of amateur radio operators. Propagation, weather forecasts, and manned spacecraft communications retransmissions may not be conducted on a regular basis, but only occasionally, as an incident of normal amateur radio communications.

97.113 does generally prohibit amateur radio operators from retransmitting signals from most other services.

BUT no one here has suggested using amateur radio to retransmit any signals from any other service. The one instance where retransmission was suspected the retransmission was on a non-amateur frequency where 97.113 does not apply. (Other rules may have been violated, but in the one instance where retransmission appeared to be involved, the service used was FRS which does not have a rule against retransmission of other services.)

Oh, I quite agree, and I thought I had made that much clear -- my comment about the signal not being strong enough to be noticed was largely of the "If a tree falls in the forest..." kind of thing.

Since the signal would be FM and probably only a few mW, that signal certainly wouldn't be strong enough to produce any audio through slope detection on an AM receiver at a distance of more than a few feet. If heard at all, it would appear as a weak unmodulated carrier, probably lost in the background noise.

BUT YES, if the signal was heard at all, there would probably be a serious enforcement effort to find and prosecute those responsible.

It wasn't the strengthy of the signal that I was labelling potentially dangerous but the mere fact that it was made at all, potentially diverting attention by pilots and controllers from the real tasks at hand, triggering possible search and rescue efforts etc. Put simply, if you have no legitimate reason to tx on the Airband, don't! It is there to provide a safety service for aircraft, no other reason.

With the amount of daily violence going on in the Baltimore area, consider yourself lucky if the big problem you have is a poor front end on the Chinese handheld radio you are using. Of course, if the Police Department there was actually allowed to enforce the laws (for a few years) you'd probably not have the need for the aerostat.

For enforcement action, the FCC does have a page showing who, what, and how much for violations. Should be able to search for FCC enforcement. You might be surprised. They may not be going out on their own looking, but they will more than likely investigate complaints.

if the bf888 can be programmed to store murs/ frs/gmrs channels and at least tx..rx.. at 1 watt i am sold.
i will read up on the bf888 more. that price of under $20 is perfect for my budget. i can definitely outfit every volunteer at the shelter with a radio and a couple to spare for backup.

For the UHF only band check out the Baofeng BF888s. They are in the 14 to 20 dollar range. By shopping I paid $13.78 each for six, free shipping on Ebay. Excellent 16 channel radio using the same system as the UV-5R but very, very basic fool proof units with few controls. Perfect for non- trained operators.

For hams it allows rubber duck monitoring or operating on UHF Ham Channels/repeaters darn near free. A very capable, amazing HT for the money.

Like the UV-5R, they are "SDR" (Software Designed Radio) and very easy to overload with other off frequency, strong radio signals. Usually not a problem with small antenna's.

But. They must be programed on a computer. They supply the program.

No comment on the legality of using them except as a FCC licensed "ham" in Amateur radio Service. But if you're using the UV-5R now, I doubt if you are too worried about that.

Bf 888 are UHF only - some really discounted versions are refurbs.

So you could not get Murs freqs.

You might want to have radio classes to get everyone certified technician class. All three Ham tests are easy and would allow members to migrate to the better legal bands without a problem.

Can someone PLEASE help me figure this out. My local police department has a receive frequency of 460.125. Their PL is 136.5. I have programmed UV-5r, UV-82, UV-6, and 888s. The 888s is the only radio that will block annoying skip from that channel. The other radios, and especially the 5r, pick up the worst noise on this channel. It's almost like the PL isn't working on enc/dec. does anyone know what is the deal? Thanks in advance. Jody. (Ps, using chirp to program)

Don't expect the range out of the BF888s (Retevis H777) that you get out of the UV5R. I have both. If bubble packs do the job the these should to. However their actual output as tested by many is around 2 watts. They are somewhat (if you don't know math) deceptively listed as <_ (I cannot create the "less than or equal to symbol) 5 watts. People misunderstand that this means anything less than or equal to 5 watts which only means that it is not more than 5 watts. With an improved antenna they do perform quite well though.

I have 7 BF888s and use two daily cycled within the 7. One had a loose knob now glued on. Because they are computer programed ONLY, I'll bet that by far most are returned to the supplier for that reason . Yes, the programing that way isn't a piece of cake requiring a learning curve and time. Yes, if you know someone who has done it would save time. But I did it so can you especially considering you programed the UV-5R which stumps a hellofalot of people. But for 14 bucks each - gee! Even if there's a 50% failure rate your ahead!
 Try one only first to learn on like I did. That way you only have $14 invested. But I was amazed at the audio/signal reports and it's strong audio for a HT. Especially a 14 dollar one. So I got 6 more. Now I can monitor full time all day almost every UHF ham repeater in the area that the BF888s will raise full quieting on the supplied apparently very good rubber duck. I didn't even bother trying other antennas of which I have a small pile. The only thing you have to get over is being a cheap skate. Another plus is that most users like them because they are so darn simple for non radio people. They even smile when they turn the channel knob and hear the Chinese accented voice telling them the channel number they are on. "KISS" in spades. Perfect for my use.
By the way, 4 of mine are the "Retevis" brand, Baofengs in disguise. 73

the bubble packs perform horribly.. i have 2 uv5r's, when i volunteer..i bring both.

one for my coordinator... the other for myself. at the low power setting..the uv5r's severely outperform the Motorola's. the shelter is an old concrete and brick building. rx and tx was difficult .. our coordinator would walk up to the second floor to tx. its more important for the volunteers to receive her tx than vice versa. if her tx needed a reply.. we would have to get on the second floor to tx or get on the intercom to page her or call her on our cell phones. .. these last 2 options are not convenient at all.

i was planning on having the shelter get a license to use these radios. then all of the volunteers can umbrella under the license for radio user at the shelter. similar to the unlicensed air soft guys using their radios at licensed fields of play.

also the accessories for the motorola radios are expensive. the uv5r's ship with hands-free ear buds.. the handset..extended batteries, can be bought for under $25 shipped off ebay.

at those prices along with another $28 for the radios.. i can afford to donate radios to the shelter and still have a couple for back up.

better comm between the volunteers will definitely make us more efficient..

if the shelter gets licensed... i will take 2 uv5r's and turn repeaters out of them.

i am really enjoying these radios.

kenneth... thank you again.

i will search fir a local HAM club. apparently my city has 2 repeaters...
i am sure the club out here is active.. i have not used my radios to hear
any tx.

i will do a quick Google search for them and see if any own the bf888.

going to read up more on the bf888 options.

thank you :)

This is not an official definition but a definition as I understand it.
A service is radio operation governed by a group of rules in Title 47 of
the Code of Federal Regulations that define that service. For Ham radio it
is Part 97. You can find the Citizen Band services(CB, MURS, FRS, GMRS)
under Part 95. And you may see reference to Part 90 operation for
Commercial radio operation(Land Mobile Radio Service).

I am NOT miss quoting, I purposely left the actual law because half the abusers on this site either cannot read or wouldn't understand. I will tell this, Rebroadcasting ANY signal with approval is against the law. And if you don't think a little 1 watt radio can cause havoc, you are misinformed! A 1 watt signal can travel around the world under the right conditions. Any way, the abusers will do whatever they want, and those of us who follow the law have nothing to fear! The one good point I will make, is Federal Prison is much better than a Local one! You can bunk with Bernie Madoff and Whitey Bulger!

> care.

IF the FCC actually told your club president ANYTHING (which I doubt), Stephen, it would only have been if he were flooding them with hundreds of frivolous and unsubstantiated complaints which wouldn't be surprising in New York City.

The only recent discussion here (and the only discussion in this the thread you replied to) was about potential interference to aircraft - which is exactly what you claim they said should be reported.

The FCC public record of fines and other enforcement actions clearly demonstrates that they do take action on cases besides those you claimed - and those public records are only the tip of the iceberg for enforcement actions because they reflect only completed actions. The vast majority of enforcement actions end with nothing more than a letter of inquiry or a warning letter. But you are right that the FCC isn't interested in useless undocumented complaints about some unidentified station that transmitted on a frequency that they may not have been authorized on or some ham slipped and used a bad word on the local repeater or other trivial one-time stuff that doesn't impact public safety and doesn't demonstrate a pattern of repeated deliberate violations.

Just out of curiosity, Why was he 'running shine' after prohibition had ended?
Prohibition ended in 1933 and the CB radio service in the US began in 1945.

Your uncle must have been a big story teller.

????

people still run moonshine now. they are unlicensed manufacturers and
sellers of alcohol for consumption.

many people in California brew craft beer in their garages.

some of them bottle and illegally sell them to others for a profit.

that's shine in a way.

In the UK, there have been a few prosecutions for misuse of the PMR446 band (very similar to your FRS). However, these cases involved use of excessive power and causing of interference rather than simple use of non-type-approved equipment.

The UK authorities tend to be more concerned with whether the transmission is within the regulations rather than whether the radio has got the right paperwork (with the exception of transmissions in the amateur and broadcast bands).

I'd be interested to know the number of prosecutions in the US for using non-type-approved equipment in a legal manner.

thank you for your party Laurence,

i have talked to a few long time HAMsters and none had recollection of any recent prosecution.

prosecution or attempts in the past were from people causing havoc by interfering with tx'ing of obscenities. purposefully transmitting vulgar clips from movies and or prolonged tx's over the 20m mark.

these were done over the frs channels.

i am unlicensed... i tx..rx at 1 watt on the MURS channels. stock uv5r antenna with the addition of a tiger tail.

these radios perform wonderfully.

where i volunteer.. i switch to the frs channels sir the shelter uses blister pack channels. at 1 watt they also perform wonderfully,

i can't say enough on how much i am impressed.

i use out for this reason...a walkie. i don't listen to broadcasts or search for public channels our dx on repeaters.

my insert $60 delivered purchase of 2 radios with accessories was well worth it.

Haven't experienced this problem, but maybe it's a bad solder joint at the switch or battery connections. I would open it up and take a look if it's too late to send it back.

It doesn't matter how hard you wish, hold your breath, or click your your heels, these radios ARE NOT LEGAL on MURS, FRS, or GMRS! Get your agency properly licensed on a business frequency and use the radios properly to your hearts content. Otherwise, please stop talking about the illegal use of these radios. It's like bragging that you just robbed a bank.

Thank you.

>
> any links or news coverage?

In the UK, there have been a few prosecutions for misuse of the PMR446 band (very similar to your FRS). However, these cases involved use of excessive power and causing of interference rather than simple use of non-type-approved equipment.

The UK authorities tend to be more concerned with whether the transmission is within the regulations rather than whether the radio has got the right paperwork (with the exception of transmissions in the amateur and broadcast bands).

I'd be interested to know the number of prosecutions in the US for using non-type-approved equipment in a legal manner.

> I am NOT miss quoting, I purposely left the actual law
> because half the abusers on this site either cannot
> read or wouldn't understand.

Which clearly puts them at your level. You put quotation marks around the junk you said was the law -- but it was not the actual wording and, more importantly (as both I and another educated member pointed out) what you said was not even close to what the regulations say.

> I will tell this, Rebroadcasting ANY signal with approval is against the
> law.

With whose approval? And why would HAVING approval make something illegal.

I would normally assume you simply meant to type "without" instead of "with" but considering your ranting I really can't be sure what you thought you meant to say.

Rebroadcasting some material WITHOUT permission might be against COPYRIGHT law; but in that is certainly not the issue being discussed here.

In the Amateur Radio Service, certain types of retransmission are prohibited in accordance with 47 CFR 97.113 (as two of us already quoted in correcting you). I cannot find any other radio service that has a similar prohibition against rebroadcast of signals from other services. There is no such prohibition anywhere in Part 95, and most importantly not anywhere in Part 1 or Part 2 other than Subpart U of Part 1 which deals with unauthorized retransmission of broadcast TV signals by Satellite TV services.

I suppose you could argue that retransmission constitutes "divulging" in violation of Section 705 of the Communications Act of 1934 As Amended (47 USC 605) but the federal courts have effectively gutted the prohibition against divulging unencrypted radio transmissions.

> And if you don't think a little 1 watt radio can cause havoc,
> you are misinformed! A 1 watt signal can travel around the
> world under the right conditions.

And what, if anything, does that have to do with anything you were ranting about?? No one has suggested that a 1 W signal cannot travel long distances and cannot interfere with other signals. Perhaps your error is in thinking that one of these radios is capable of putting out a 1 W signal on the frequencies that were being discussed. Or perhaps the problem is that you just enjoy raving on and on about matters that are outside your very limited areas of knowledge and therefor enjoy creating spurious

strawman arguments so that you will have something to rant and rave about.

Plus if you do get a Part 90 frequency to use, you need to have Part 90 stickers on the radio indicating this fact. I got 5 uv5R/Pofung small box radios in last week for someone who had to have these stickers to be fully compliant. They cost me an extra $10 over the common advertised prices too (per radio)

Better yet get the UV82 C radios instead

It doesn't matter how hard you wish, hold your breath, or click your your heels, these radios ARE NOT LEGAL on MURS, FRS, or GMRS! Get your agency properly licensed on a business frequency and use the radios properly to your hearts content. Otherwise, please stop talking about the illegal use of these radios. It's like bragging that you just robbed a bank.

Thank you.

All of this talk of what's legal and what isn't has prompted me to find out if my own operation of my two Baofeng radios are fully legal.

In addition to my Yaesu FT1DR, I also own a UV-5 RA, and also a BF-F8HP. I do not have a commercial radio license, but I do have a General-class Amateur license. Using CHIRP, I have locked out all Tx except the 144-148 and 420-450 MHz Ham bands. All of my programmed frequencies are within the Ham bands. There is no FCC ID sticker on either of my Baofengs.

Is my use of these radios, as detailed above, fully legal?

Can you be more specific on your channel configuration? Are you setting both a TX and RX PLs (which would be the same) on some or all radios? Also how do you know it is skip and not just overpowering interference? Is there audio as in someone talking and if it is skip, where is it originating from and how did you identify this? Could it just be bleed over from an adjacent frequency which is a very common problem with these radios?

I can tell you that setting a receive PL (assuming that the repeater/simplex you are listening ito s transmitting the same PL needed to open the repeater) can help block out some interference, but it the interference is powerful enough it will still overpower the front end and break squelch.

More details on your configuration and the type of "skip" you are receiving would help us help you.

Jody,

How are you making sure that all radios have been programmed the same?
Are you copy and pasting the working BF-888s channel to all of the
other radios?

The simplest way to program this would be...
Tone Mode = TSQL
ToneSql = 136.5

This programs the tone for both RX and TX. If you want it for RX only then...
Tone Mode = Cross
Cross Mode = ->Tone
ToneSql = 136.5

Both the UV-5R and UV-82 should show CT in the left status display
when tuned to the programmed channel. When when tuned to the
programmed channel, accessing menu 11 (R-CTCS) the display should show
136.5HZ.

You should also be able to test this out by manually programming the
UV-5R and UV-82 in VFO mode. Enter 460.125 (depending on the firmware
version this may require setting menu 1 (STEP)=5KHZ) into the VFO and
set menu 11 (R-CTCS)=136.5HZ.

I got a UV-5R about a week ago and have had very little trouble setting it up and programming it, both by KeyPad and Software. One thing has me a little baffled. I have several frequencies programmed to channels. Now, when you are in the Channel Mode is there a way “call up” those channels other than scrolling up/down for them with the Arrow Keys? This seems like a poor way to have to do it.

I have tried just inputting a channel number, but that does not seem to work.

Any help appreciated! Thanks

50427. Re: [baofeng_uv5r] Amateur Radio Service

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-30 17:29:46 UTC
From: Xaun Loc
Topic: 50333 Message: 50427

Absolutely, John. The The steps you have taken are not required, but some of those steps could help prevent accidental violations.

The Amateur Radio Service is unique among the radio services regulated by the FCC.

Unlike most other radio services, the Amateur Radio Service requires an individual Operator's License for each person who will control the radio. This is a fundamental difference which makes most of the other differences possible.

Unlike most other radio services, the Amateur Radio Service (at least nominally) requires operators to be familiar with the rules & regulations as well as with the technical aspects of radio communication, and "good amateur practice." (Unfortunately the methods for ensuring that familiarity have been watered down to the point where they are nearly useless.)

Unlike most other radio services, the Amateur Radio Service does not require equipment to be type-accepted, "certificated" or otherwise approved by the FCC.

Unlike most other radio services, the Amateur Radio Service allows (and even encourages) operators to modify or even build their own radios.

Unlike most other radio services, the Amateur Radio Service generally allows operators to operate on any frequency within authorized band segments rather than on specific frequencies (this is not true of all bands but it does apply to most).

In the case of the steps you described, all your equipment was already fully legal. Locking out transmit on frequencies outside the amateur bands would eliminate temptation and the risk of accidental out-of-band transmissions. No FCC labels are required for you to use your equipment because you are personally responsible for ensuring that your equipment operates properly. The only FCC approval requirement that applies to any of the equipment you mentioned is that the manufacturer must certify that the equipment meets Part 15 requirements for the equipment to be imported and sold. Most such equipment is marked with a label that includes the FCC logo (The upper case F followed by a letter C with another letter C centered inside it). This requirement addresses the strength of any RF emissions from the radio while it is NOT keyed to transmit and is essentially the same requirement that applies to your computer equipment as an "Unintentional radiator" (i.e. a device that emits RF even though it is not intended to transmit radio signals).

Did you mean _without_ approval? How does this affect low-power devices used for in-home distribution or to feed the car radio? In the UK, such devices are often used to relay the programme from another receiver. We have several licence-free allocations at both UHF and VHF (including, at very limited power, Band II).

> And if you don't think a little 1 watt radio can cause
> havoc, you are misinformed! A 1 watt signal can travel around the

Not often at VHF, and never (to my knowledge) at UHF. Though a few hundred miles is not that uncommon.

Having had to take my "original" UV-5R apart to fix a minor problem in the past, I can tell you that it is in NO WAY water resistant. Immersion would flood the circuit board immediately.
Can't speak to the other flavors of cases.
By contrast, my Quansheng TG-UV2, while more expensive, is better protected with seals and a rubber coating on the speaker. But they don't advertise it as a feature, and I wouldn't want to take it for a swim if I could prevent it.

I have had good luck with Aquapac for my smartphone. Just worth mentioning if they sell something for the Baofeng. Some people have suggested the use of Ziploc type bags for the freezer as a good substitution for water proof bags. When buying electronic items, they sometimes include little bags to help with moisture. The same can be done with rice too. Just some ideas.

Yes, I do carry my license in my wallet. Good to know I can use my Baofengs legally. My favorite is still my FT1DR, but for everyday carry and use, the Baofeng can't be beat. I've already scratched the UV-5RA pretty badly - I would've been angry had I done that to the Yaesu. At $35 and $75 (for UV-5RA and BF-F8HP), they make perfect backup or daily use radios.

The LED on my charger flashes green and red when fully charged, and not a steady green.
Also the red LED on the wall wart does not light up.

I also carry my license in my wallet, next to my other licenses like driving a car. Anyone who has a mobile or portable radio most likely does too.

Whenever I buy any type of portable electronic item, whether it’s a Baofeng, smartphone or tablet, I do buy the case for it.

Bruce

Yes, I do carry my license in my wallet. Good to know I can use my Baofengs legally. My favorite is still my FT1DR, but for everyday carry and use, the Baofeng can't be beat. I've already scratched the UV-5RA pretty badly - I would've been angry had I done that to the Yaesu. At $35 and $75 (for UV-5RA and BF-F8HP), they make perfect backup or daily use radios.

Rob,

Baofeng has advertized a radio that's supposed to *eventually* be IP67 waterproof, but I don't believe that they have actually reached that level yet. Of course that won't stop their marketing department from claiming it anyway. In the meantime, you might want to check out the watertight HT bags from Powerwerx.

Solid green with a flashing red (look close) is an indication of an error.

What radio is the charger for?

What voltage is measured at the output of the wall wart?

What voltage is measured at the output of the charter (the farthest
apart terminals).

50440. Time to charge BL-5 in CH-5?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-30 23:18:42 UTC
From: muzzo@...
Topic: 50440 Message: 50440

Hi all, just got my 4 UV-5r's and ordered the BL-5's extra for each one. I have read and read posts on the forum but so far haven't found one to answer my particular question. I see postings that say the BL-5 can be happily charged in the "standard" CH-5 charger that comes with the UV-5R but I can't see any mention of the time it "should" normally take. Maybe I am asking a little too premature? The 1800 mah batteries each took around 6 hours so would the 3800 take 12 hours? It has been a bit more than 12 hours and the first of my 3800 is still charging with the red led lit solid. Perhaps I need to wait some more? How long are people seeing that it takes to charge theirs - via the CH-5?

Also by using one of the TYT external chargers into the socket on the 3800 mah battery itself - how long are owners seeing for time to fully charger the BL-5?

It makes sense to me to make a few charge and discharge cycles to get the new batteries up and running well. I have cycled each of the standard batteries by leaving each radio on overnight with the led torch left on - but it will take a bit longer with the BL-5's to do it this way. Does anyone have any ideas for a circuit to build a custom cycler. I know I can do what I have done for the standard batteries - but am thinking I would like something a bit more custom and quicker.

Xaun

You are well versed on the regulations. Let me ask you this question.

I do programming for radios here, I do not ask for licensing or other proof from customers unless they want something in the Pub Service bands. I do put monitor channels in and disable tx (duplex off)

I have license material info I give out for free with various license materials. I lecture everyone they need a license before operation and it is their responsibility to do this.

I just had the asshole of the month come here at our table giving us rules and regs and threats to report us to the FCC for helping people with their radios.

Is this something I should worry about? I see no regulations selling, listening, or programming a radio for someone.

I'm getting sick of these types that seem to be the main reason few women or younger types want to get into Ham radio these days. This type drives people away from the hobby.

90% of my customers contact me within a few months with their new call sign thanking me for starting them into Ham radio.

However, if asswipes keep bothering me I will completely shutdown all programming and technical help leaving customers to fend on their own.

That would be less trouble for me anyway.

Subject: Re: [baofeng_uv5r] Amateur Radio Service

Absolutely, John. The The steps you have taken are not required, but some of those steps could help prevent accidental violations.

The Amateur Radio Service is unique among the radio services regulated by the FCC.

Unlike most other radio services, the Amateur Radio Service requires an individual Operator's License for each person who will control the radio. This is a fundamental difference which makes most of the other differences possible.

Unlike most other radio services, the Amateur Radio Service (at least nominally) requires operators to be familiar with the rules & regulations as well as with the technical aspects of radio communication, and "good amateur practice." (Unfortunately the methods for ensuring that familiarity have been watered down to the point where they are nearly useless.)

Unlike most other radio services, the Amateur Radio Service does not require equipment to be type-accepted, "certificated" or otherwise approved by the FCC.

Unlike most other radio services, the Amateur Radio Service allows (and even encourages) operators to modify or even build their own radios.

Unlike most other radio services, the Amateur Radio Service generally allows operators to operate on any frequency within authorized band segments rather than on specific frequencies (this is not true of all bands but it does apply to most).

In the case of the steps you described, all your equipment was already fully legal. Locking out transmit on frequencies outside the amateur bands would eliminate temptation and the risk of accidental out-of-band transmissions. No FCC labels are required for you to use your equipment because you are personally responsible for ensuring that your equipment operates properly. The only FCC approval requirement that applies to any of the equipment you mentioned is that the manufacturer must certify that the equipment meets Part 15 requirements for the equipment to be imported and sold. Most such equipment is marked with a label that includes the FCC logo (The upper case F followed by a letter C with another letter C centered inside it). This requirement addresses the strength of any RF emissions from the radio while it is NOT keyed to transmit and is essentially the same requirement that applies to your computer equipment as an "Unintentional radiator" (i.e. a device that emits RF even though it is not intended to transmit radio signals).

To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Re: UV-5R doesn't display 7 characters in channel name

All of this talk of what's legal and what isn't has prompted me to find out if my own operation of my two Baofeng radios are fully legal.

In addition to my Yaesu FT1DR, I also own a UV-5 RA, and also a BF-F8HP. I do not have a commercial radio license, but I do have a General-class Amateur license. Using CHIRP, I have locked out all Tx except the 144-148 and 420-450 MHz Ham bands. All of my programmed frequencies are within the Ham bands. There is no FCC ID sticker on either of my Baofengs.

Is my use of these radios, as detailed above, fully legal?

Excellent question, and I will acknowledge up front I don't know if there is a specific part of the regulations regarding this.

It is the responsibility of the licensee to operate within the terms and limitations of their license. Normally, that is done by providing anyone using your system with a radio programmed for your operations and in compliance with your license. The operator doesn't need to know anything about those technicalities other than "turn to channel 2 and push to talk". They can't set the radio to do something not in compliance with your license. That's the whole point of equipment certification, making sure the equipment can't be used wrong (assuming it is set up correctly to start with).

But what happens when someone comes along with their own radio that has your licensed frequencies in it, and chooses to operate on your system? How do you as the licensee control that? Simple, have a rule that says nobody can use their own equipment. Typical for most business/commercial/public safety operations. As a licensee, you can protect yourself with such a rule, and if there is a violation, the offender (the person using the non-authorized radio on your system) is the potential subject of a notice of violation, fine, or whatever (should it come to that). They would also be subject to your own company employment policies (in other words, you could fire them for doing so).

That then raises the question of how did that person come to have a radio programmed to operate on a particular system without your (the licensee's) approval? Years (decades) ago, you had to have a first or second class FCC General Radiotelephone license to even program a radio. It was all but impossible for anyone without such a license to even obtain the ability (hardware/software) to program a radio. Those days are long gone (possibly a good thing, possibly not - pros and cons).

You can now buy, brand new, a Part 90 radio that comes programmed out of the box with an assortment of itinerant VHF and/or UHF frequencies. Frequencies you must have a license to operate on. But you can buy the radio with them already in it. Does that make the manufacturer or seller of that radio liable for improper use of the radio? Apparently not, or you would think it wouldn't be possible to sell a radio that way. There is of course a disclaimer in the operator manual that says the frequencies require an FCC license.

Following that same logic, if you sell someone a radio and they ask you to program it with such and such frequency and tone, does that place any liability on you should they subsequently use that radio illegally? I would argue if you can buy the radio already programmed, it is no more or less improper to program a radio for someone. It is their responsibility to use it in accordance with the regulations and provisions of the license under which they will be using it. Advising them of that fact would certainly be appropriate, but policing them after the fact certainly isn't your job.

Personally, I won't program stuff into a radio for someone unless I know they are authorized to use it. But then I'm not a retailer or a business, I support a specific group of volunteer emergency workers and know what they should (and shouldn't) have in their radios. Once they walk away from me, if they choose to reprogram their radios and put in

everything and anything they think they might possible need someday just in case, it's on them, not me, if someone challenges their use of that radio. As the person responsible for developing and distributing our radio policies and plans, I make sure those clearly state what our people should have in their radios (and only that). But most of the radio equipment is personally owned by the volunteers, and there is simply no (reasonable) way to police/enforce that. We tell them what they can and should do, give them clear written guidance, and if they choose to not comply with that, at least they aren't putting our licenses and operations at risk.

For anyone operating a radio on non-amateur frequencies, you should have written documentation that justifies your use of whatever frequency, power, ERP, antenna, and emission type you are using. Or, you should only be using a radio issued to you by the licensee.

The other side of this entire discussion is "so what". What happens if you do break the rules? Most of the time, nothing. As has been noted here, the FCC simply does not have the resources to be chasing down minor violators. Unless you are causing harmful interference to a licensed system, it is quite unlikely anything will happen. If I were selling radios and programming them to my customer's specification, if I had the request, in writing of what they wanted, along with a disclaimer advising them of the requirement for proper licensing, I think you would be covered whether or not they provide a copy of the actual license. The likely exception to that would be putting a radio on a known police or fire system without written approval from them.

Hi Graham

You asked "but I can't see any mention of the time it "should" normally take. Maybe I am asking a little too premature? The 1800 mah batteries each took around 6 hours so would the 3800 take 12 hours?"

And to truly answer you I will say the following: I have 4 UV/BF radios and they all have the BL-5 in addition to the regulars that came in the box with the radios. Initially it will take longer to charge any battery, but once you get going, say after 5 or 6 Charge/Discharge cycles things should taper of to the "normal" behavior. My batteries have been in service for about a year now, and I average about 7 to 8 hours of charging, say from 30-40% capacity to 100% capacity using the same charger that came in the box with the same radio.

BTW its never advisable to drop a battery to 0%, it will not like it.

"has been a bit more than 12 hours and the first of my 3800 is still charging with the red led lit solid."

For a brand new battery that might not be a point of concern (just yet), but 1) Make sure the battery is well seated in the charger, 2) And if it's connected to a radio the radio MUST be turned off. You may get erratic behavior if the battery has to charge and power the radio simultaneously.

"Also by using one of the TYT external chargers into the socket on the 3800 mah battery itself - how long are owners seeing for time to fully charger the BL-5?"

In my experience I have found it to be about 15-20% longer than AC charging, but again your mileage may vary depending on the age and pattern of usage of the battery.

"but it will take a bit longer with the BL-5's"
I tuned in the radio to a semi active repeater, and on receive 99% and transmit 1% the BL-5 lasted from the Morning of a Sunday until the mid day of a Tuesday. With the LED on, I would guess it will go to the following Saturday, or about 14 days if not longer. I would suggest that you plug in a frequency and let the volume be very low so that you can sleep at night. One BL-5 lasted from the first light at Field Day until Sunday late afternoon, with 50% transmit time.

Hope this helps

The manufacturer normally puts them on the radios. The seller is responsible for ensuring they have them if they advertise them as such.

One supplier on here said Baofeng shipped him some when asked which seems a bit odd but Baofeng does sell these units without them apparently.

They put on at the factory for us. A few months back someone in the group stated they had to pay $15 for the stickers per qty 1.

This is close to what we pay which is about 10-15 extra per radio compared to the regular sticker versions

Have you tried reading the directions on the Miklor website?
Those directions include telling you how to call up the memory channels BY JUST INPUTTING THE CHANNEL NUMBER
But you do need to do it correctly (hint: ALL the channel numbers are three digits)

Subject: [baofeng_uv5r] How to Up Memory Channels?

I got a UV-5R about a week ago and have had very little trouble setting it up and programming it, both by KeyPad and Software. One thing has me a little baffled. I have several frequencies programmed to channels. Now, when you are in the Channel Mode is there a way “call up” those channels other than scrolling up/down for them with the Arrow Keys? This seems like a poor way to have to do it.

I have tried just inputting a channel number, but that does not seem to work.

Any help appreciated! Thanks

According to the FCC requirements, the Transmitter ID label must be installed by the manufacturer at the time of manufacture.

Many years ago, when I held a commercial Radio Telephone Operator license (which used to be required to repair & adjust radios for radio services other than amateur radio), some manufacturers would let you obtain a replacement label as a "repair part" for radios being reconditioned but they were generally strict about you having to prove you were a licensed technician AND that you had a legitimate radio that needed a REPLACEMENT label.

Apparently BaoFeng is no more interested in following this FCC requirement than they are in actually meeting the Part 90 technical requirements that they told the FCC in writing the radio meets. (The FCC apparently isn't very interested either since their requirements include a copy of the manual that comes with the radio and if anyone at the FCC had read the manual that BaoFeng sent them as part of the application they would have known the radio does not meet the Part 90 requirements.) BaoFeng definitely has provided FCC Transmitter ID labels to dealers for use on radios that came from the factory without the label.

According to what I was told by a dealer, at one time BaoFeng was putting the US FCC label on radios that were being assembled/packaged for shipment to the US and putting the domestic China market label (which is in English oddly enough) on all radios not being sent to the US. Now apparently BaoFeng wholesales the "identical" radio with the label for a higher price than without the label.

An interesting aside to this distinction is that SUPPOSEDLY in the original system the radios being exported to the US received somewhat stricter testing that that used with radios for the domestic Chinese market.

I bet you a cold beer, that the extra testing the 5 radios I got with the stickers on them was done by just peeling off the old sticker and putting on the Part 90 ones in the same place .

However, they did cost us more and I did this as a favor for those that wanted to be Part 90 compliant and requested versions with the stickers.

I was also told they are backing off the uv5R Part 90 versions (which is why you do not see them much anymore like in the past) and pushing more towards the Uv82 versions instead (like the uv82C)

The label comes installed on the radio by the manufacturer when they make
the radio.

As long as the radios you are selling CAN BE used legally, you do not have any legal obligation to ensure that they WILL BE used legally.

The FCC has repeatedly stated quite clearly that legal OPERATION of a radio is the responsibility of the operator.

We both know that you can legally sell a ham radio to someone who does not hold a ham license, just as Walmart (et al) can legally sell a FRS/GMRS bubble pack HT to customers who do not have a GMRS license.

There are some specific equipment items that are illegal to offer for sale, but almost all of these are for transmitting in 26-27MHz neighborhood. The FCC has also seized inventory of non-certificated transmitters in other bands (such as some of the 5 W and 25 W FM Broadcast transmitters) but to the best of my knowledge they did not attempt to fine or otherwise prosecute the seller.

I don't believe there is any issue with the FCC over selling a legal radio even if you suspected or knew the buyer intended to use it illegally. It is POSSIBLE that some insane county prosecutor (most of them ARE insane) might try an "abetting" or "conspiracy" charge if someone you provided a radio was being charged under state law or a local ordnance concerning misusing the radio if the prosecutor thought they could prove that you knew (or that a reasonable person would have known) that the person intended to commit a crime with the radio (for example, your gang members who want police frequencies programmed). Such a charge would be difficult to make stick but it could still be costly to defend yourself if you were indicted (unlikely but possible).

The procedures you describe are entirely legal and should be entirely adequate to demonstrate that you did nothing wrong.

From: mailto:baofeng_uv5r@yahoogroups.com

Xaun

You are well versed on the regulations. Let me ask you this question.

I do programming for radios here, I do not ask for licensing or other proof from customers unless they want something in the Pub Service bands. I do put monitor channels in and disable tx (duplex off)

I have license material info I give out for free with various license materials. I lecture everyone they need a license before operation and it is their responsibility to do this.

I just had the asshole of the month come here at our table giving us rules and regs and threats to report us to the FCC for helping people with their radios.

Is this something I should worry about? I see no regulations selling, listening, or programming a radio for someone.

I’m getting sick of these types that seem to be the main reason few women or younger types want to get into Ham radio these days. This type drives people away from the hobby.

90% of my customers contact me within a few months with their new call sign thanking me for starting them into Ham radio.

However, if asswipes keep bothering me I will completely shutdown all programming and technical help leaving customers to fend on their own.

That would be less trouble for me anyway.

THAT would be a sucker bet.

From: mailto:baofeng_uv5r@yahoogroups.com

I bet you a cold beer, that the extra testing the 5 radios I got with the stickers on them was done by just peeling off the old sticker and putting on the Part 90 ones in the same place .

However, they did cost us more and I did this as a favor for those that wanted to be Part 90 compliant and requested versions with the stickers.

I was also told they are backing off the uv5R Part 90 versions (which is why you do not see them much anymore like in the past) and pushing more towards the Uv82 versions instead (like the uv82C)

According to the FCC requirements, the Transmitter ID label must be installed by the manufacturer at the time of manufacture.

Many years ago, when I held a commercial Radio Telephone Operator license (which used to be required to repair & adjust radios for radio services other than amateur radio), some manufacturers would let you obtain a replacement label as a "repair part" for radios being reconditioned but they were generally strict about you having to prove you were a licensed technician AND that you had a legitimate radio that needed a REPLACEMENT label.

Apparently BaoFeng is no more interested in following this FCC requirement than they are in actually meeting the Part 90 technical requirements that they told the FCC in writing the radio meets. (The FCC apparently isn't very interested either since their requirements include a copy of the manual that comes with the radio and if anyone at the FCC had read the manual that BaoFeng sent them as part of the application they would have known the radio

does not meet the Part 90 requirements.) BaoFeng definitely has provided FCC Transmitter ID labels to dealers for use on radios that came from the factory without the label.

According to what I was told by a dealer, at one time BaoFeng was putting the US FCC label on radios that were being assembled/packaged for shipment to the US and putting the domestic China market label (which is in English oddly enough) on all radios not being sent to the US. Now apparently BaoFeng wholesales the "identical" radio with the label for a higher price than without the label.

An interesting aside to this distinction is that SUPPOSEDLY in the original system the radios being exported to the US received somewhat stricter testing that that used with radios for the domestic Chinese market.

From: Andrew West
Topic: 50372 Message: 50456

Yes, Part 13 does cover commercial broadcast radio.

Part 90 covers commercial two-way radio. Which is the context of this conversation It is also known as business(commerce) band. The fact that I chose to use the word commercial instead of business is a personal preference. I did preface my statement as "not an official definition but a definition as I understand it".

"§ 90.31 Scope. The Industrial/Business Radio Pool covers the licensing of the radio communications of entities engaged in *commercial* activities, engaged in clergy activities, operating educational, philanthropic, or ecclesiastical institutions, or operating hospitals, clinics, or medical associations."

50457. UV-5R Radios (and variants) Now Have Working Squelch?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-05-31 13:54:59 UTC
From: rock.unroe@...
Topic: 50457 Message: 50457

I saw in another forum that someone with a UV-5R V2 with N5R2407 firmware claims to have made a video showing that the squelch indicator actually works (not just ON or OFF).

Would some of you with new radios verify this? Check your radio to see if the squelch indicator actually functions and then reply with the result and the "real" firmware version of your radio obtained using CHIRP (in other words don't report BFB297 ;-).

Thanks in advance,
Jim KC9HI

Thanks for the info, looks like I will need disclaimer signs and papers to put all around to indicate this fact as it seems verbally informing potential buyers they need a license before operation is not good enough.

A better idea I am going to start taking pictures of some of these characters I have to deal with and will create a web site just like the “People of Wal-mart” will be the “People of disgruntled Ham radio.”

LOL

Yes, Tom. "Signal strength indicator" would have been a better way of saying it.

Hi Jim,

I have N5R2407 firmware and yes, it does work.

Test conditions:

1978 signal generator, calibration unknown but apparently working OK. Here's what I got.

0.25uV, first two bars (short ones) some smooth white noise. Could not set the generator lower.

0.7uV 3 bars

2.8uV 4 bars,

10uV 5 bars.

It will be interesting to see the findings of others, but there is no doubt about one thing:

My old generator produces variable levels in the microvolt region, and the '5R does indicate different strength levels on the indicator.

I did then play around on a repeater, and waved the radio around on the incoming signal. And yes, the strength indicator varied as expected.

Bear in mind that my vendor stated that there have been hardware changes (later chip versions) in my radio. The main processor, the FM receiver, and the audio chip are apparently to later versions.

They still have not got rid of the "pulsing bug" when it resumes from an active channel to FM broadcast reception, when battery save is set... Oh well, one day :-)

From: stanwhite_snr@...
Topic: 50464 Message: 50464

Battery life. As in how long it runs before a recharge is necessary, or how long before replacement?

I just made a mod to the charger:

A 1N5819 in series with the +ve battery lead. Placed instead of the jumper from the circuit board to the spring terminal.

A 20K variable resistor in parallel with the diode. (I used a 20k 10 turn trimpot, but the adjustment is quite broad, not critical at all).

Charge battery until it is not getting any higher in voltage, and then while monitoring the current (analogue meter, 50 microamps full scale, set the resistor to give an average current of 0 microamps. (It will be pulsing + and - at this stage.) Actual current has been measured at +/- 6 microamps.

The charger acts as before, with flashing red/green if there is no battery in it, red for charging, and green for charged. Only now, the charge terminates around 8.2 volts. I tested both an 1800mA/hr battery, and a 3800 variant.

At 8.2 volts, expect the battery to have around 90% charge. And also expect to double the cycle life (time between battery purchases).

Even lower charge voltages will give less capacity, and more cycle lives.

There is, however, something I have not checked. (I am about to "flatten" a battery to do so...):

With a fully discharged battery, it is my belief that the charger gives a low "wake up" current. My mod may result in the charger thinking that the battery is in a partially discharged condition, rather than fully "flat", and may start with a normal charge. On the other hand, the resistor allows current to flow back around the diode, thus "telling" the charger it is actually "as flat as a pancake", so that could "save the day".

Incidentally, my laptop battery is five years old, and around 50% of what it should be. I have the facility to limit the voltage on that, and have always done so. (I only use it on the grid supply).

Your thoughts?

Hi Tom,

Just one, very small one, adjacent the actual antenna symbol. Both SQ=0, and monitor button pressed.

You may also like to know that for low power TX, three bars, and for high power, 5 bars.

Happy days!

Stan,

As far as I know, that is the way it has always been for the TX power level. Three bars and 5 bars for low and high power respectively for radios with 2 power levels. It is 1 bar, 3 bars and 5 bars representing low, mid and high power respectively for radios with 3 power levels.

Hi Stan,

Were these measurements made on a radio with the "stock" squelch thresholds or were they modified prior to the measurements using CHIRP?

Hi Jim,

New radio, and no mods to the squelch levels. Just programmed in (Chirp) with frequencies from another one of my radios. (Via csv file).

It is interesting to note that you are thinking "squelch", and I am thinking RF microvolts, because I never thought about there being a co-relation between the "S" meter settings and the squelch, although of course, there will be.

Which is making me think, (and possibly this is where you are coming from), will the squelch settings in Chirp alter the workings of the RF receive signal meter....

I'll try to find out after dinner.. It is 19:17 here :-) I'll make some different squelch settings and repeat the sensitivity tests with the signal generator. See if the meter behaves differently.

Many thanks for the advice and comments. I thought maybe the UV-5X was "water resistant".

I think I'll go with a bag next time around. I can say with real experience to back it up, the UV-5R is not water resistant when sitting in a water-tight bag that was not sealed and filled up with water for 60 minutes or so, which is what happened to me.

Hi Jim,

As promised:

The signal meter reacted exactly the as before, i.e

0.25uV, 2 bars
0.7uV 3 bars
2.8uV 4 bars
10uV 5 bars

Squelch settings (UHF) was
0
19
20
21
22
23
24
25
26
27

And was set to the following for the test:

0
5
10
15
20
25
30
35
40
45

In both cases, the squelch level in the radio setup was at level 5. (i.e. 22 originally, now 20), and 0.25uV resulted in the squelch opening, with smooth noise.

That little radio sure is sensitive,

Rob,

Many times Chinese vendors have a very liberal use of English words or phrases, many of them equate "splash resistant" to "water proof", which of course doesn't mean the same thing at all. I don't own a Baofeng A58 (yet), but it would be interesting to test one in a bucket of water for 30 minutes to see if it actually is IP67 rated (as the marketing department at Baofeng claims). My guess (and at this point, it's only a guess) is that this claim won't actually turn out to be 100% valid. In all likelihood, the radio is probably splash resistant only, but I sure hope that someone lists them for sale on Amazon, so if it fails my water bucket test I'll have no problem sending it back.

There are very few circumstances that ownership of equipment can get you into trouble, especially passive receivers. If you try and transmit or do transmit, different ballgame. I carry a copy of my FCC license just in case a police of other similar type officer questions why I am walking around with a HT. I do have my HT's programmed to receive police and fire, but don't make it obvious that I am listening to them at a first responders event.

If questioned, should I lie and say, no, this radio is not capable of transmitting on their band? Or tell the truth, it can, but I don't have it programmed to do so? Wouldn't know how to answer that.

I still think it is true in states like Ct, it is illegal to either own or use a radar detector. If you think about it, it is just a passive receiver, but still maybe illegal to use (or own). Or maybe it is now legal?? I don't know. I don't live there.

Ive never heard of the FCC seizing gear from a Ham. Non-ham gear can be

part of a Ham's junk pile he or she is thinking about modifying for Ham use.

Illegal use would probably make the FCC think and act differently.

On Sun, May 31, 2015 at 12:48 AM, 'Xaun Loc' xaunloc@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

As long as the radios you are selling CAN BE used legally, you do not have any legal obligation to ensure that they WILL BE used legally.

The FCC has repeatedly stated quite clearly that legal OPERATION of a radio is the responsibility of the operator.

We both know that you can legally sell a ham radio to someone who does not hold a ham license, just as Walmart (et al) can legally sell a FRS/GMRS bubble pack HT to customers who do not have a GMRS license.

There are some specific equipment items that are illegal to offer for sale, but almost all of these are for transmitting in 26-27MHz neighborhood. The FCC has also seized inventory of non-certificated transmitters in other bands (such as some of the 5 W and 25 W FM Broadcast transmitters) but to the best of my knowledge they did not attempt to fine or

otherwise prosecute the seller.

I don't believe there is any issue with the FCC over selling a legal radio even if you suspected or knew the buyer intended to use it illegally. It is POSSIBLE that some insane county prosecutor (most of them ARE insane) might try an "abetting" or "conspiracy" charge if someone you provided a radio was being charged under state law or a local ordnance concerning misusing the radio if the prosecutor thought they could prove that you knew (or that a reasonable person would have known) that the person intended to commit a crime with the radio (for example, your gang members who want police frequencies programmed). Such a charge would be difficult to make stick but it could still be costly to defend yourself if you were indicted (unlikely but possible).

The procedures you describe are entirely legal and should be entirely adequate to demonstrate that you did nothing wrong.

From: mailto:baofeng_uv5r@yahoogroups.com

Xaun

You are well versed on the regulations. Let me ask you this question.

I do programming for radios here, I do not ask for licensing or other proof from customers unless they want something in the Pub Service bands. I do put monitor channels in and disable tx (duplex off)

I have license material info I give out for free with various license materials. I lecture everyone they need a license before operation and it is their responsibility to do this.

I just had the asshole of the month come here at our table giving us rules and regs and threats to report us to the FCC for helping people with their radios.

Is this something I should worry about? I see no regulations selling, listening, or programming a radio for someone.

I’m getting sick of these types that seem to be the main reason few women or younger types want to get into Ham radio these days. This type drives people away from the hobby.

90% of my customers contact me within a few months with their new call sign thanking me for starting them into Ham radio.

Update...

Ran the battery out until the radio went off. Battery voltage zero. (Proving the battery has some protection electronics in it). Connected to unmodified charger. Immediate 400mA charge.

My modified charger does that also. So it looks like it is OK to place the diode in series as above, and get a lower charge voltage for longer life.

Menu 25 (SFT-D) and menu 26 (OFFSET) only function in VFO (frequency) mode. In VFO mode the upper status display will show + or - based on the setting of menu 25.

Menu 25 and menu 26 have no function in MR (channel) mode. The programmed channels do not have any shift or offset information in them. Instead they are programmed with the RX frequency and the TX frequency (shift and offset are not needed).

Since there is not shift or offset information in a programmed channel the upper status display shows "+-" whenever the RX frequency and TX frequency are different (as it would be in the case of a channel programmed for a repeater, odd split, cross band or TX inhibited).

So unless Baofeng had made a recent change, it is normal for these radios to indicate these channels with a "+-".

The only Baofeng radio that I know of that will indicate a "+" or "-" for a repeater in channel mode is a UV-B5 or UV-B6 and that is a completely different radio than the UV-5R radios that this group discusses.

Maybe someone from Baofeng is a member of the group and decided to fix the complaints about the squelch issues.

I will mention some radios with the newer firmware will not read within the same versions.

Example exact same firmware dates will give write errors requiring to download from radio first, usually they will accept the same versions.

I stopped try to keep track of the firmware changes. It became too complicated. Radios with the same firmware version and date would have different features and behavior.

this is an interesting radio, however we cannot seem to sell them as they are a “Baofeng” and cost more than $30. I argued with someone who kept bothering us today for one that claimed it is being sold on Amazon for $30 and figured that is the price he should get plus a free programming cable and setup because it uses a different programming cable.

A quick look on Amazon indicated the prices were the same or more than ours for this model.

Had some guy argue with us that the UV82 2m/1.25 on our table was $10 more than Ebay’s price. I loved the look on his face when I told him to buy it on Ebay instead.

Rob,

Many times Chinese vendors have a very liberal use of English words or phrases, many of them equate "splash resistant" to "water proof", which of course doesn't mean the same thing at all. I don't own a Baofeng A58 (yet), but it would be interesting to test one in a bucket of water for 30 minutes to see if it actually is IP67 rated (as the marketing department at Baofeng claims). My guess (and at this point, it's only a guess) is that this claim won't actually turn out to be 100% valid. In all likelihood, the radio is probably splash resistant only, but I sure hope that someone lists them for sale on Amazon, so if it fails my water bucket test I'll have no problem sending it back.

Yea the radios have xmt turn off on the scan only channels. Usually I put 5 end channels in if requested for a local scan capability. No tones or offsets either in them.

I think I am going to get something from the FCC to put on the table as this seems to be happening too much with us getting nut jobs harassing us. This guy must have been 300+lbs overweight with a 300lb wife to boot with really nasty attitudes. Their BMI mass blocked the whole entrance.

You could smell him from 10 feet away too. I do not want these types hanging around the table, especially if belligerent. They serve beer here so that does not help.

It looks like I will be putting my Police Camera Mic to good use as I am going to start taking pictures of these incidents with the body cam we sell. Generally it was for potential theft prevention but now it will be recording some of these characters which will make it to YouTube..

Maybe this will make interesting filler clips for the instructional videos we do.

I am sure the FCC does not hire these characters so his claim of being with the FCC doesn’t cut it. Generally, I ignore or laugh about these things but this particular person was very loud and would not leave until we sent someone to find security. You gotta love it, just doing online stuff via Amazon looks better and better these days.

If you have the radio programmed such that you cannot transmit on police/fire, you would be entirely honest in stating the radio can't transmit on those channels. If you reprogram it so that it can, then you would have a different answer.

Yea you would need a dual band liquor bottle to keep from going crazy trying to figure out all the changes. Too bad they really do not have a good dealer support section to let the dealers know what is going on. Baofeng really messed up on the dealer's side by selling directly outside a potential network they could have built. I was hard to sell them and break even with competition from various internet outlets. So we will not get them unless per request. I do get the HP versions though, A58, and others but no more Gen I-II versions unless something is unique.

Baofeng could move their mobiles better too if they had a dealers network. Most do not want to carry them due to getting stuck with something you have to sell lower than you originally bought it for. Hence, BaoFeng's reputation is cheap-toss away radios. That is too bad as they are really good radios and most likely their mobile market is not going to take off unless they have a unique product to sell.

A decent revision and support page would be a good start instead of having Hams try to figure out what they did. More information can be found on a few pages on Miklor than the whole Baofeng corporate website.

What are trying to do? Compete with that website "People of Walmart"? They'd probably brag about it (being on 'tube) and try to sue you for making them look bad at the same time. I can sympathize. I've worked in well known (now defunct) electronics chain store and had an 11 meter repair business (even the commercial license required) and with what you see on occasion, you begin to believe in devolution. :-)

Rich,

Have you tried actually to verify the Baofeng claim of being IP67? I'd hate to see you waste a good radio, but if you ever get a radio with a bad LCD and plan to send it back anyway, it would be a fun test.

Unfortunately you only have to spend a few days in sales (especially in retail sales) to see how some folks have "devolved". I don't know if it's entirely based on their gene pool, or general upbringing (lack of manners), or lack of education, or all three (and perhaps even other factors like crime or drugs).

Whatever the reason or cause, it's clear that more and more of these folks exist. Rich has far more patience than most, but unfortunately I don't think his idea of posting a letter or notice from the FCC (even if he could get one) would work, as he'd first have to teach these folks to read. Even "if" they do, they'd ignore it anyway, as one of the dead giveaways to their attitude is always, "I'm right, everyone else is wrong."

Welcome to Yahoo -- there is a reason that some people refer to it as Ya-Hell

Messages from YahooGroups get passed to one of many Yahoo servers in bunches. Then the server tries to send those messages to the mail server for the destination domain. Many servers (especially those operated by smaller ISPs and hosting services) set limits on how much mail they will accept in a single connection. If the Yahoo email server trying to send out the message bumps into such a limit, it does not try again later with the rest of the mail - instead it just marks all the undelivered messages as having bounced. Such messages are simply discarded.

Messages from YahooGroups may also arrive out of sequence for very similar reasons -- the Yahoo server that has a particular message may be tied up sending other messages elsewhere meanwhile a later message will be passed through a different server and may get delivered before the first server gets around to you.

This can also happen with Google Groups, but it does seem to happen much more often with Yahoo and Yahoo seems to not do as good a job of handling such issues (a few years ago Yahoo managed to actually blacklist one of their own outbound mail servers as a known source of spam so that it couldn't connect to Yahoo's inbound mail server - and it took them several days to figure it out!)

No not yet only got a few in for display and testing. A fire department though bought them as backups without any issues- so far.

Rich,

Have you tried actually to verify the Baofeng claim of being IP67? I'd hate to see you waste a good radio, but if you ever get a radio with a bad LCD and plan to send it back anyway, it would be a fun test.

On Sun, May 31, 2015 at 5:52 PM, 'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

this is an interesting radio, however we cannot seem to sell them as they are a “Baofeng” and cost more than $30. I argued with someone who kept bothering us today for one that claimed it is being sold on Amazon for $30 and figured that is the price he should get plus a free programming cable and setup because it uses a different programming cable.

A quick look on Amazon indicated the prices were the same or more than ours for this model.

Had some guy argue with us that the UV82 2m/1.25 on our table was $10 more than Ebay’s price. I loved the look on his face when I told him to buy it on Ebay instead.

Rob,

Many times Chinese vendors have a very liberal use of English words or phrases, many of them equate "splash resistant" to "water proof", which of course doesn't mean the same thing at all. I don't own a Baofeng A58 (yet), but it would be interesting to test one in a bucket of water for 30 minutes to see if it actually is IP67 rated (as the marketing department at Baofeng claims). My guess (and at this point, it's only a guess) is that this claim won't actually turn out to be 100% valid. In all likelihood, the radio is probably splash resistant only, but I sure hope that someone lists them for sale on Amazon, so if it fails my water bucket test I'll have no problem sending it back.

Things have not changed much Bob. Today was a better day we didn’t have to take pictures or get security. No thefts from the tables and no gang members asking for some illegal help or programming.

I did have someone quiz me about getting them tools to crack encryption and where to buy stingray cell phone interceptors. That is about it.

What are trying to do? Compete with that website "People of Walmart"? They'd probably brag about it (being on 'tube) and try to sue you for making them look bad at the same time. I can sympathize. I've worked in well known (now defunct) electronics chain store and had an 11 meter repair business (even the commercial license required) and with what you see on occasion, you begin to believe in devolution. :-)

Yea the radios have xmt turn off on the scan only channels. Usually I put 5 end channels in if requested for a local scan capability. No tones or offsets either in them.

I think I am going to get something from the FCC to put on the table as this seems to be happening too much with us getting nut jobs harassing us. This guy must have been 300+lbs overweight with a 300lb wife to boot with really nasty attitudes. Their BMI mass blocked the whole entrance.

You could smell him from 10 feet away too. I do not want these types hanging around the table, especially if belligerent. They serve beer here so that does not help.

It looks like I will be putting my Police Camera Mic to good use as I am going to start taking pictures of these incidents with the body cam we sell. Generally it was for potential theft prevention but now it will be recording some of these characters which will make it to YouTube..

Maybe this will make interesting filler clips for the instructional videos we do.

I am sure the FCC does not hire these characters so his claim of being with the FCC doesn’t cut it. Generally, I ignore or laugh about these things but this particular person was very loud and would not leave until we sent someone to find security. You gotta love it, just doing online stuff via Amazon looks better and better these days.

Hi all again,

I've got surprised due to the number of answers to this post, and was hoping to get my problem solved. Unfortunately it didn't :-(

I think this thread has become off-topic. I kindly suggesto to you to open new threads to talk about new issues or themes, what do you think?

By the way, I suppose no news about the 6 characters problem and possible solution, could somebody tell me something if possible?.

Thanks.

Your radio was changed at the factory to only display 6 characters. It is only capable of displaying 6 characters. There is nothing that can be done about it.

In the UK, the authorities have the power to remove _any_ equipment they
believe is relevant to the alleged offence. This could include ham gear,
other radio kit, and in at least one case the suspect's record collection.

It's unusual for anyone to be prosecuted simply for posession of
prohibited equipment unless there is a suspicion it has been used, but
it will be confiscated.

I know. I give you guys credit. Senior moments are one thing but the other... whew![?] The guy that wants a 25 A fuse for his car stereo because the 5 A "failed" and blew out. I tried to explain him he might have bigger problems, but no, he insisted the fuse failed. He never came back. The problem with a chain store is you can't refuse to sell them whatever, you could get fired.
There's the difference between ignorance and stupidity (ignorance - not knowing, stupidity - refusing to know). Having recently ended my almost 40 years in the education field, I've seen too much of the latter.
Still think you should record these "events" and publish a book listing them. I'd be first in line at the book store. Keep in mind, by going from vacuum tubes to transistors, we've reduced the number of candidates for the Darwin Awards.

The FCC issued an order years ago, to get around car scanner laws, that it pre-empted any law
that prohibited possession, by a Ham, of a radio which capable of transmitting or receiving on
Ham bands. Hams have good rep with public safety/emergency folks that most of them treat
you well. Especially if they have had to use Ham for backups. I was licensed in Oakland, CA
when it was a real "fashion police" that regulated and taxed anything it could except for Ham
antennas. There is some leeway under PRB-1 for locals to regulate; in Oakland they didnt because
Hams will patrol for fires in fire season. Same as in the midwest city where I now live as we will chase
storms and tornadoes.

I want to clone a BF-F8 to the settings from a 5R. The settings on the 5R have been saved on my computer. So I assume I just open CHIRPS open the stored file from the 5R, then upload it to the BF-F8. It this the correct procedure, or is there something different because the radios are two different models.

An suggestions appreciated!!

I would copy from the 5r file and paste into the BF8 file, I have had issues with doing what you described because the firmware versions are different.

Not the right way…

#1 Ensure you have the latest daily build of CHIRP – it will prevent you from doing what you just said. The older "standard" version will brick your radio and you'd have to reaload a good image.

#2 Download the image from your BF-F8 and SAVE it as a backup.

#3 If you have the daily build you can upload the image from the 5R – CHIRP will complain after it uploads the channels and stop from messing with the radio settings.

What always works even with the old version, after Step #2, is also open the local 5R copy, and copy/paste the channels over to the BF-F8 window.

Subject: [baofeng_uv5r] Cloning Between Different Models With Chirp

I want to clone a BF-F8 to the settings from a 5R. The settings on the 5R have been saved on my computer. So I assume I just open CHIRPS open the stored file from the 5R, then upload it to the BF-F8. It this the correct procedure, or is there something different because the radios are two different models.

An suggestions appreciated!!

it is for me using chirp and two different UV-5r models
just highlight on one, select copy, paste it into the other one.

Left click the first "Loc" column, shift-left-click the last one you want, right-click and Copy, go to the other window and right-click the 1st "LocL", Paste, then click "All" when it asks if you want to overwrite.

There is no simple way to do that. The problem is that the microphone requires being plugged in to both jacks - and when you plug it in, that disconnects the internal speaker. You can't even remove the plug for the speaker because that plug is needed for the mike to key the radio.

To get the internal speaker to stay on with the mike plugged in, you would have to disassemble the radio and add a jumper wire to the speaker jack to defeat the cutoff - then both the internal speaker and the speaker in the mike would be active.

If you wanted to stop the speaker in the mike, you would have to also disassemble the mike and disconnect the speaker.

So, it CAN be done, but it seems to be a lot of trouble to accomplish absolutely nothing.

To do this without opening up the radio and external microphone you should be able to carefully cut the tip and ring part off of the Ø2.5MM pin (the smaller pin) to leave only the sleeve. The pin will then be too short to disable the internal speaker but enough should remain to be able to key the radio up with the external PTT button.

To avoid altering the external mic, you might engineer some sort of extension cable that you could shorten the Ø2.5MM pin.

Ummm....

There's actually an even easier method...

#1... as with all ALL radios, when brand new, download an image into CHIRP (using latest daily build), and save it as a factory image. That's your back-up.

#2... Download a second time your NEW radio, then save that one as your "working" copy.

#3... Assuming you already have the *.img saved for your UV-5R, you don't need to copy and paste. With your "Working" copy of the BF-F8HP, go to "File"... "Import"... then in the file type dialog box pick chirp image (it's the *.img files)... then double click that file.

#4... A new box will pop up where you can change the channel numbers if needed...

#5... Then pick OK

#7... Your channels that are High power on the UV-5R will be MED power on the BF-F8HP... Just go through and change the ones that you really need the 8Watts (well 7.5) for and all is good.

Another way I've done this is to program a UV-5R with the load out I want, then go from radio to radio with a cloning cable and just dump the plug to the other radios. High power stays High power, and it works pretty quick with multiple radios. The BF-F8HP will not initiate a clone, but the UV-5R's and BF-F8+'s will.

Hope this helps. Because once you do the import thingy, you're going to start buying your radios on the basis that they have chirp support because then you can have all your loads the same channel.

That won't work. What you need to do is download the info from the one that will be the clone an cut and paste the info from the one you're copying into that, then upload it. There are other goodies in there that will mess up a unit with different firmware.

Affirmative there. Having introduced the Baofeng to the local old-timers as a "Chow-Yuk" radio, I also use chirp for a Yaesu FT-8900R (mobile) and Icom ID-51A.

Dan Smith KK7DS can be admired endlessly for making his intellectual property available to others without charge, just as many others do ... those who donate to the chirp project are also to be admired. When the firmware dust settles on a new Yaesu product, I'll purchase an FT-991 and hopefully make it available to Dan for his inclusion into the daily chirp updates.

The channels and settings of one Baofeng radio can only be directly uploaded into another Baofeng radio if the firmware versions exactly match. Any difference at all and the upload will be stopped immediately.

A lot of people suggest that you copy-and-past to transfer channels from one radio to another. It is certainly the most convenient, but it is not the most thorough method for doing the job.

Exporting to a CSV file and then importing the CSV file back in to the new radio is another method that gets recommended a lot. It has more shortcomings than copy-and-past and requires an extra step to export to a CSV file.

The best way to get channels from one radio into another radio is to import the CHIRP Radio Image (*.img) file from the "master" radio. Importing a radio image file brings in the "extra" settings like BCL and PTT-ID that copy-and-past and importing from a CSV file misses. It works the same way a importing a .CSV file, you just choose *.img instead of *.csv after selecting Import.

The fellow who taught my tech course had a batch of
5r that he got, and had programmed with a list of
repeaters. I got a 5r off Ebay, which refused to take
the programming. Different firmware.

===quoted text====
Process would be to connect and download from black UV5R,
and 'file/save' it as black.img ,
then,
You should be able to (in chirp) 'file/export' the channel
info to a UV5R.csv file, edit that file with notepad (excel may
make some unnecessary changes) then in chirp again 'file/import'
to the black radio, and finally rewrite the black.img just
to make sure.

Then connect and download from the blue radio, and do the save
blue.img, 'file/import' the UV5R.csv file to have the same
freqs setup in both. then save the blue.img again.

Any edits should only be done to the UV5R.csv and imported
into both to have identical channel setups.
===end quote===

I hope that makes any sense at all.

For the price, these are excellent radios.

You need to download the most current version of chirp. Then you need to download from the radio once that is done you can import your list of repeaters from the chirp image you have and then you can upload to the radio

In my environment, I did something similar.

External speaker-mics are cheap enough that you can cannibalize
one for the cord.

I have an external Motorola speaker that sounds much, much better
than the tiny Baofeng speaker. The speaker came from ebay with a
cut off cord for $5. I took a stock unmodified speakermic cord and
installed that cord into the Motorola speaker case and connected it
to the speaker pins, and to a pair of jacks that I installed into the
outside of the speaker case.
The stock speaker-mic plugs into the jacks. They are wired so that
the microphone works, but the speaker in the microphone case is
disconnected.

Bear in mind that none of these procedures will copy the settings, only the channels. You have to enter the settings manually unless someone has found a shortcut to copying settings to dispirit radios.

Jim, since you seem to be the Chirp expert here, I have a different variation I want to ask about. I just got an FT60R which I would guess has a totally different settings structure than the Baofengs. I want to get the same channels from my Baofengs into my FT60R (which is Chirp supported) . I don't know if it is possible to also import any of the like settings. So my question is if I do the Import as you describe from a BFF8+ to the FT6-R as an example, would that only copy the channels or some of the like settings as well as you described below? Or should I do it differently due to the different brands?

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

If you click on the leftmost part of a row (Loc),the entire row will highlight. You can hold CTRLand select multiple lines. Right click one of the
lines and select Copy. You can then paste thesein to another tab. I've moved memories from myIC-2100 to my FT-587 and my UV-5R. The tags, tonesand offsets transfer over to the new tab.

Jim, since you seem to be the Chirp expert here, I have a different variation I want to ask about. I just got an FT60R which I would guess has a totally different settings structure than the Baofengs. I want to get the same channels from my Baofengs into my FT60R (which is Chirp supported) . I don't know if it is possible to also import any of the like settings. So my question is if I do the Import as you describe from a BFF8+ to the FT6-R as an example, would that only copy the channels or some of the like settings as well as you described below? Or should I do it differently due to the different brands?

Hi group I am new to the Baofang group and am awaiting the arrival of my UV-5R. Can anyone recommend a good microphone for the radio ?

I know there are a few links and a few mics out there but I always think its better to ask and find out from people who have tried them.
I am in the UK and as usual they hump the prices up.
Any help would be great.

Thanks Chris Mi0CBH

I have three Wouxun radios. And a genuine Wouxun speaker mike that fits those (UV6D x 2, and a UV8D).

That speaker mike works very well on my UV5Rs :-) It should be noted that although there were quality control issues with earlier UV5Rs, later ones seem a lot better. They also produce good outgoing audio on their internal mike.

I've tried the shoulder microphone speaker unit. People
complain the talk volume is very low. I've ended upsing
the mic that's in the unit itself. Lower left of the speaker.

And talk LOUD to be heard.

I personally haven't tried that cable, but MTC (Main Trading Company) is a very reputable dealer.

So if they say it will work, then it will work.

I got the speaker microphone from Ebay. Others tell
me the transmit audio is terrible. It was suggested
the mic hole does not line up with the mic element.
I found this true on my mic.

Took it apart, and drilled a hole to allow some sound
in. A couple fellows (few minutes ago) were kind enough
to test equipment with me. They tell me the internal
mic is much better than the shoulder mic. Actuall usage,
tried both.

They did suggest the similar Kenwood shoulder mic,
which is about ten dollars on Ebay.

Hi Richard,

It can't be done from the keypad any more. It used to be that you would power the radio on with the [3] key pressed and get the firmware version. The BFB297 firmware (released over 2 years ago) was the last firmware version that you could read using this method. After that, Baofeng started to hide the real firmware version. All UV-5R variants since then continue to display BFB297 in the [3] key + Power-on message.

The only way to get the "real" firmware version it to read the radio using the CHIRP programming software and then look it up on the Settings -> Other Settings menu.

Thanks for the info Jim. Both of my recently purchased UV-5R units display BFB297, so I presume they are recent manufacture and the firmware version might be something else. Thanks again for the info. I did have a brainstorm after I asked the question and looked at the MIKLOR FAQ page and found the answer.

50544. Re: Disable speaker into mike

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-04 02:23:21 UTC
From: blunder@...
Topic: 50514 Message: 50544

I've done this very thing with Icom, Kenwood and Yaesu hand held radios in the past. I have disabled either the mic part or the speaker part for particular uses of the particular radio at the time...

The only way I did this was to buy a few extra mics as spares just in case, and cut the curly cord a few inches from the plug end on one of them and solder the correct wires onto the correct pin of the correct plugs. I used two separate plugs instead of the one twin plug, so I could choose which I wanted to use and which to leave unplugged. I also bought a few mic curly cords so I could use the end straight sections of this and join the wires onto the plug with enough length to create soldered joins and cover each join with heat shrink tube then one large heat shrink over the original and the new sections of curly cord to hide the join, They usually turned out quite good and worked well. Keep the original plugs somewhere so that you can change it back over if you need to in the future...

I did just this by using a Kenwood H/H dual bander miniature speaker mic for an Icom UHF CB 40 ch H/H radio way back in the mid 90's. On this one I simply re-routed the all the wires to the correct designations of Icom mics while using the same twin plug because it fitted the Icom radio. It worked very well,, and when I bought my Wouxun KG-UV8D dual bander last year, it worked a treat straight away,, just plugged right in and worked... Since finding out about some poor quality Chinese made audio sockets however, I stopped using it,, that and the fact that I wound up disliking the UV8D and no longer use it.. It is not a good radio. That's when I bought the first Baofeng UV-5R. What a difference... I just use it as is though...

On my BF-F8HP, pressing the 6 during power up shows "150412N" which, I assume is a firmware date code of some sort. In Chirp, the firmware message 1 is "F5R3407" and firmware message 2 is "F8HP-1".

50548. Re: [baofeng_uv5r] Firmware identification

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-04 10:33:45 UTC
From: Jim Unroe
Topic: 50539 Message: 50548

The original post was in reference to a UV-5R. The UV-82 and its variants and also the BF-F8HP and its variants have their own unique firmware version format.

Firmware Message 2 is the firmware version that is displayed during the [3] key + Power-on message ([5] key + Power-on for most UV-82 models).

Firmware Message 1 is the "real" firmware version that, without the use of CHIRP, is normally hidden from the user.

The data in the [6] key + Power-on message does appear to be a date. However, it is unknown if it is a firmware date, a circuit board manufacturing date, a radio build date or something else altogether. Unlike the firmware version, the [6] key + Power-on message can be overwritten and/or edited after the radio leaves the factory so the information that it displays should be considered unreliable.

50549. Baofeng pack: NiMH or alkalines

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-04 12:13:00 UTC
From: Christopher Young
Topic: 50549 Message: 50549

With the six AA cell pack for Baofengs, which
provides more talk power?

Six NiMH AA cells
five alkaline AA cells and a dummy cell

????

All -

On a UV-5R bought through Amazon.co.uk about a month or so ago, information obtained via Chirp:

Firmware message 1: HN5RV01
Firmware message 2: 1FB297
6+Power-on message 1: 150304N

Hope it helps.

5 alkalines has a slightly higher voltage, 7.5v vs. 7.2v on the 6 NiMH, so the alkalines should give a slight edge on TX as the batteries discharge. usage time is determined by ah capacity, not just voltage, so that needs to be considered.

If my old tired memory is working, alkalines run 2650 mA
hours, and the NiMH I've got are not rated (but did see
some where on the web they are good fo 2000 mA.

Alkallines are light years better than carbon cells for
transmit. But, NiMH are supposed to be better in
camras (high drain charge flash).

Might call for some field testing.....

Thanks for helping me think this through.

50555. Battery drain

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-04 23:06:15 UTC
From: Michael Black
Topic: 50555 Message: 50555

A friend of mine has two UV-B5's from Amazon and says the batteries won't stay charged in either one more than a few days.

He's going to test one with the battery out but I suspect he's seeing a problem reported here before.

I found one thread about it without a lot of info.

Has anybody got any experience/sage advice on this matter? He's had them for close to a year.

Mary,

Please give us more information about what you have done.

How are you programming your raid (keypad, CHIRP, OEM, other)?

It the static that you are hearing when you are listening to the
repeater or or are others hearing stating from you when you talk?

Do you have another radio that you can compare it to?

Do you have a spare antenna or can you borrow one?

What it the radio model?

Perhaps something, perhaps nothing. The only thing we can be sure you are "doing wrong" at this point is asking for help without telling us what is happening.

You say there is static when you try to transmit - but you don't tell us what is actually going on. If you are transmitting, you should not be hearing anything at all.
If you are hearing static from your radio, then it certainly isn't transmitting.
If you mean that others report hearing static on your signal when you transmit, that would seen to suggest that your signal is either weak or slightly off frequency.
If you mean that you are listening to another radio tuned to the repeater output and you hear static on that radio when you transmit, then this could involve a weak or off frequency signal or desensing (see FAQ 2.2), or a combination.

Mary,

I had a similar problem sometime ago with a Motorola Hand Held, found that the antenna connecter had a cold solder at the PC board, also had one with noise on RX, found the battery contacts were dirty and if you move the battery cover the battery would move ever so little and make noise in the speaker.

Hope this may help you out.

Topic: 50549 Message: 50566

Yes voltage means nothing alone. Remember the basic formula V X A = W (or V I = P). It also has to have the current to support the load. I have NiMH batteries rated as high as 2650 mAh (tested at actual 2475mAh) thus (if you believe the factory) matching alkaline. Basically NiMH batteries will hold up better (with the dummy in alkalines to make the voltage match) longer under high load conditions than alkaline. However NiMH batteries have a very high self-discharge rate unless they are Eneloops. NiMH will lose power just sitting there much faster than alkaline, so for backup power they are almost useless, but if you are using them frequently and can afford them, they are great.

Here is a pretty good myths vs facts page: Battery Myths vs Battery Facts

Garage store – to my other half’s dismay.

Will be going on vacation for a few months this Summer so will be shutting down. I do traveling expo events and shows to keep busy a good excuse to go to Vegas too.

I sell or display mostly military collectables and odds/ends but being a Ham I do radio stuff too.

What are you looking for? I did test the new Tri-Power versions 8W on VHF and slightly about 6W on the UHF side with my power meter.

It looks like the new Tri-powers will all be this way as they are tweaking the bias levels and have the newer boards in them. (same as the BF F8+ HP so far) Same generic case though, says uv5R nothing cosmetically different with them.

I do have a new Uv 9D Wouxun version that looks good along with the newer 3318 Anytone E model Tri-bander, and the TYT F9D Tri-banders

Will test them out this weekend in the high desert. If you are looking for a radio really look into the 3318 if you have a good 220mhz system there. Our system is linked all the way to Washington state and is pretty good. That makes getting a tri-bander a worthwhile task. I am looking at reliable Tri-banders that do 6M too but waiting for the new launches to come out and investigating some P25 radios.

I do not make much money doing this but it keeps me busy and is a good excuse to buy radios and fool with stuff without getting yelled at.

FYI I am getting in a really nice copy of the PRC117G and PRC 152 versions in, Not cheap, but fully Ham operational display pieces. If you are a military buff , reenactor , airsoft player ,or collector the PRC117 will be really nice.

These odd ball type stuff is what I like playing with.

A website is pending it needs more work but will end up looking pretty good when done, I hope to do this on vacation if possible. Will post a link later when completed.

When I use my UV-5RPlus locally I have no problem but when I go to another town and try to call a friend of mine there he can hear me calling but I can not hear him or his friend when they call me or reply to my calls? Does anyone have an idea what the problem may be and how to correct it? As far as I know I am on the correct frequency because they can hear me. I just am not able to hear them On the local repeater I can receive just fine. I am heard and can hear. I have changed my antenna on the car from the "rubber ducky" to a magnet mount and when I checked the SWR on the magnet mount was 1.2:1. First time I ever mounted an antenna and did not have to set SWR it was that low just off the get go.

Sounds like you may have a receive PL tone set.

Are you putting the frequencies in using software or from the keypad?

Unfortunately you haven't given us any information about how you have programmed your radio or what you programmed it with.

Just guessing, you programmed the channel with a receive CTCSS tone or receive DCS code and your friend is not transmitting the matching tone or code. If that is the case, everything is working perfectly.

When that channel is selected, do you see a CT or DCS indication near the top of the left status area?

Using OHHM's Law EI=P Where E is equal to voltage, and I is equal to amperage (in milliamps) and P equal to POWER INPUT in watts to the Transmit final transistor, you will find that the difference between the NiMH and alkaline batteries NOT DECERNABLE at the receiving station. the difference is maybe about 1/2 watt input maybe. The benefit to NiMH is longer transmit/receive time before you need to replace or recharge your batteries. NO ONE on the other end of you conversation will know the difference until you tell them. So saying that, if you think you get 6 watts out of a 4 watt transmitter, you forgot to take into consideration the Class the transmitter is operating in (C, A, AB, B etc.) each having a different percentage from input to output! Just go with the expense of the NiMH batteries and forget about "talk power" your not running an amplifier here and FM is FM, you can't make more out of it than there is!

From: Mile Kokotov
Topic: 50581 Message: 50587

May be the problem is out of band strong RF signals in the new location, so they actually block your receiver front end, which is very sensitive but not selective in cheap hand-held transceivers...

I was tried to connect better antenna instead original antenna to my UV-5R in order to increase working range. But I noticed that with better antenna the receiving signals was actually worse !?
(tried Nagoya 771, Nagoya 106, Nagoya 108, Diamond X-30 and home made Dipole for 2m band)
The corespondents send me a better receiving reports but, unfortunately, in most of the cases I copy them worse or not at all...

Thinking about this unexpected problem, I come to conclusion that connecting any better antenna to UV-5R,

actually you exposes the receiver front end to strong out of band signals. Especially if you live in urban area with many RF signals around, like strong FM broadcast stations and so.

The Baofeng UV-5R is wonderful little handheld transceiver with wide-band frequency range, but nothing is perfect, so UV-5R is not perfect too.

Many wide-band receivers suffering from low receiving dynamic range just because they are wide band and at their front-end (when you connect a good antenna) the receiver "see" many out of band signals as well (like strong FM broadcast signals) so they easily can block the receiver and we can not receive weak signals of interest. By the way, a good tracking filter is imposible to include in the little transceiver of that price range.

The producer equipped this little handheld UV-5R with just good enough antenna to making local contacts, and at the same time, antenna is as bad as not being blocked by strong out of band signals...

To solve this problem, I made myself a bandpass filter for 2 m band (145 MHz). Now I can connect better antenna without receiving problem. I can hits repeaters up to 100 km away !

You can check my youtube video of the details about my home made helical bandpass filter, so you can make it too:

145 MHz Low Loss Bandpass Helical Filter by Mile Kokotov

Hi,

I have 4 UV-5R's and I want to make a repeater with two of them. I'm going to buy a 2.5 to 3.5 mm cable adapter instead of a duplexer to save some money.

I just have a couple questions:
1) I'm planning on buying two car antennas and putting these onto my 20' mast which I've already set up. Will car antennas work?
2) How far apart do the antennas need to be? Doesn't the transmitting antenna deafen the receiving antenna because of the EMI?

Thanks.

Do you want an in-band repeater (such as a 2 meter, both frequencies are in the 2 meter band), or a cross-band repeater (one radio on 2 meters, the other on 70cm)?

For an in-band repeater, you either need a duplexer, or a LOT of antenna separation. If the antennas are directly above and below each other, probably at least 20 or 30 feet of vertical separation. If there is any horizontal offset, then double or more the separation.

Also, use very good coax. RG58 "bleeds" enough signal to desensitize the receiving radio.

If you are going for a cross-band repeater, then be careful that your VHF and UHF frequencies are not an exact factor of 3 from each other (which can easily happen between the 2 meter and 70cm ham bands).

Last thing to consider is to make sure you coordinate your repeater with whatever your local coordinating body is. Just putting one up is not the best idea, as you can easily cause interference with an existing, coordinated, system.

If you are going to crossband, there are a couple of handhelds that can do that alot easier by themselves than using 2 separate units. The Puxing 973 would be one, I think the Wouxun KG-UV 8 is another.

Hello All,

Unless I am missing something, and this maybe the case here, I do not see the "why are you doing this" explanation?!

I was under the impression that repeater enhance your communications by

1) powerful re-transmitter, a 4 watt radio is not that much of a boost

2) High antenna that has a better "Line of Sight" footprint, 20' is not that significant of an advantage?

Sorry for being the "devil's" advocate, but what is the end application all about and are there better solutions to that end.

Barring education and proof of concept experiments, the fact that you can do something is never a justification to do that something. You need MUCH MUCH more that just that.

So again, if I am missing something I am sorry, but I would love to learn new stuff.

You do repeaters like that to get over and around obstacles. Like mountains, cliffs, etc.

I'm getting ready to test a balloon cross band using a Wouxun KV-UV8D for search and rescue purposes. You can go to 500ft on a tethered balloon without FAA approval.

I'm going to put a Harvest RH-660S antenna which is a ½ wave on VHF and 5/8 on UHF.

I'm doing this as we had a rescue last year in a hilly area where the repeater we put up at 50ft wasn't high enough and the terrain mapping I've done shows 500ft should be able to get everywhere we need to go.

Ok, with your handheld on simplex to another handheld normal distance is about 2mi in decent terrain. take that 2mi range and put a simple repeater up in the middle and you can talk from A to B upto 4mi away with the repeater being in the middle.
Now as you raise the antenna of the repeater that distance grows exponentially

I'm getting ready to test a balloon cross band using a Wouxun KV-UV8D for search and rescue purposes. You can go to 500ft on a tethered balloon without FAA approval.

I'm going to put a Harvest RH-660S antenna which is a ½ wave on VHF and 5/8 on UHF.

I'm doing this as we had a rescue last year in a hilly area where the repeater we put up at 50ft wasn't high enough and the terrain mapping I've done shows 500ft should be able to get everywhere we need to go.

Hello All,

Unless I am missing something, and this maybe the case here, I do not see the "why are you doing this" explanation?!

I was under the impression that repeater enhance your communications by

1) powerful re-transmitter, a 4 watt radio is not that much of a boost

2) High antenna that has a better "Line of Sight" footprint, 20' is not that significant of an advantage?

Sorry for being the "devil's" advocate, but what is the end application all about and are there better solutions to that end.

Barring education and proof of concept experiments, the fact that you can do something is never a justification to do that something. You need MUCH MUCH more that just that.

So again, if I am missing something I am sorry, but I would love to learn new stuff.

You do repeaters like that to get over and around obstacles. Like mountains, cliffs, etc.

I'm getting ready to test a balloon cross band using a Wouxun KV-UV8D for search and rescue purposes. You can go to 500ft on a tethered balloon without FAA approval.

You could buy a cheap, but good parrot repeater - depending on expected traffic. There are very low costs units that connect to your radio, record what they hear, then retransmit this seconds later. You only need one radio and they operate on simplex. Also you will want to consider the fact that hand helds are meant for short duration transmit only - anything over 60 seconds and you may be looking at increased heat. But for short info exchanges a hand held with a parrot repeater attached - up in a balloon or similar would be simple and have no desense to worry about. Worth considering.

Hi.

I also have a Yaesu VX-5R; for many years now, I've use an after-market belt clip arrangement from http://www.theclip.com http://www.theclip.com on it. It's never failed me. I was wondering if anyone had used one of their products to replace the supplied (flimsy) Baofeng belt clip, and if so, which adapter was used?

Save yourself some more money and forget this idea.

Car antennas will work, but the spacing needed would be about 50 feet or more if you are talking about a conventional single band repeater. You can reduce that a bit by setting up a cross-band repeater but the wide-open front-end used on these radios makes it very difficult to prevent the transmitting radio from totally desensing the receiving radio.

These radios are also not capable of surviving the high duty cycle typical of repeater operation. If used very sparingly, and with the transmitter locked on low power it would be feasible for a short term use.

Still, if you are determined to try:

1) be sure to use Receive Tone or DCS on the receiving radio, DON'T use any tone on the transmit radio for the "repeater"

2) set up the receive radio on UHF and the transmit radio on VHF set for low power and set the time-out-timer for one minute or less.

3) ensure that the control operator is present at the radios' location at all times

4) ensure that the control operator identifies with his/her license call letters at the appropriate times

5) space the antennas as far apart as you can -- since the antennas are vertically polarized, you can get a little advantage by placing the receiving antenna about 20-30 feet directly above the transmitting antenna instead of 40-50 feet apart horizontally.

From: bardya.aminian@... [baofeng_uv5r]

Hi,

I have 4 UV-5R's and I want to make a repeater with two of them. I'm going to buy a 2.5 to 3.5 mm cable adapter instead of a duplexer to save some money.

I just have a couple questions:

1) I'm planning on buying two car antennas and putting these onto my 20' mast which I've already set up. Will car antennas work?

2) How far apart do the antennas need to be? Doesn't the transmitting antenna deafen the receiving antenna because of the EMI?

Thanks.

But they have to be separated vertically not horizontally so that one does not feed into the other, especially if you aren't setting up a cross band repeater.

If you don't mind spending about $25 you can buy the whole interface setup (radio to radio, not antenna) for this called Sainsonic RPT-2D. This can be tricky to get working, but no more so than if you make the interface yourself. Especially if you are doing in band repeater where you have to have huge vertical separation between antennas without a duplexer. Choose your frequencies carefully and use low power transmit until you are sure you won't interfere with repeaters in your area. If you do up your power and you are going to leave it up, you should coordinate it with the authorities.

Good luck

50608. BL-5 Battery - goes bang!

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-07 12:33:34 UTC
From: muzzo@...
Topic: 50608 Message: 50608

As mentioned in an earlier email I bought four UV-5r's. I also bought four of the BL-5 extended 3800 mAh batteries. The first battery I charged I left on for 48 hours - waiting for the LED to indicate green that the battery was charged - but it never came on - LED stayed constant red. Battery reads 7.9v and operates the radio fine. The second battery was on for 36 hours - and when I came back to the shack it had swelled badly and puffed up and spilt the case to the extent the internals are now twice the thickness due to swelling. These have all been put on charge on the standard UV-5r desktop charger - CH-5. After finding the second battery burst I swapped over charger bases and power packs, to see if the two remaining batteries will accept charge. Third battery initially showed the green/read flashing LED - all night and a pert of the day. Later in the day the solid red LED was on. I have taken this one off after 24 hours. Number four is now in the charger - green/red LED flashing. The BL-5's showed zero volts when taking out of their packets, so initially the charger does not know they are there or displays a fault - flashing. I realise there will be initial charges to bring the batteries up to full working - but was surprised at both the very slow initial uptake - most of 12 hours to even start taking a charge, and secondly not showing they were fully charged via a solid lit LED. Maybe I need to cycle them a few times?

The standard batteries that came in the radios were charged in the box already. I initially left them on overnight with the LED torch on to start their first cycle. I cycled each twice so far. All standard batteries show a solid green LED when charged.

So before approaching the seller of the BL-5's I am looking for some feedback. I did ask specifically if the CH-5 would charge the BL-5's perfectly - and was told yes. I just don't want to risk damage/fire from any future unattended charging of the BL-5's. I know there is a recommended charger - TYT . something .... to plug into the DC socket on the battery itself - I don't have one and understood I did not necessarily need one - but now? Also I didn't get a clear answer from my previous post if the "external" TYT type charger actually has LED indication to show the state of charge. Can anyone confirm if there are LED's to show Charging/Charged states?

Thanks, and aplogies for the windy post - but the more information I can give, the more my situation can be understood and any responedents are better equiped to help.

Thanks!

One bad thing about this video, it is suggesting using freqs that are in the public safety area of Part 90. This requires a license to use, and probably freq coordination, also. These freqs can interfere with Fire, Police, Ambulance, and Search and Rescue. This set up should stay in the Amateur bands with properly licensed ham radio operators. It would still be easier to use a single ht that is capable of cross banding on its own, without going through the expense of 2 hts, a cable or interface unit, 2 extra antennas, 2 coaxes, etc.

From: cprendon@...
Topic: 50608 Message: 50619

One trick to Baofeng chargers that I have found is ALWAYS place the battery in the charger with NO power to the charger, then power up the charger. That is true of the 120VAC USA chargers at least. Otherwise you can get all kinds of false readings.

---In baofeng_uv5r@yahoogroups.com, <muzzo@...> wrote :

As mentioned in an earlier email I bought four UV-5r's. I also bought four of the BL-5 extended 3800 mAh batteries. The first battery I charged I left on for 48 hours - waiting for the LED to indicate green that the battery was charged - but it never came on - LED stayed constant red. Battery reads 7.9v and operates the radio fine. The second battery was on for 36 hours - and when I came back to the shack it had swelled badly and puffed up and spilt the case to the extent the internals are now twice the thickness due to swelling. These have all been put on charge on the standard UV-5r desktop charger - CH-5. After finding the second battery burst I swapped over charger bases and power packs, to see if the two remaining batteries will accept charge. Third battery initially showed the green/read flashing LED - all night and a pert of the day. Later in the day the solid red LED was on. I have taken this one off after 24 hours. Number four is now in the charger - green/red LED flashing. The BL-5's showed zero volts when taking out of their packets, so initially the charger does not know they are there or displays a fault - flashing. I realise there will be initial charges to bring the batteries up to full working - but was surprised at both the very slow initial uptake - most of 12 hours to even start taking a charge, and secondly not showing they were fully charged via a solid lit LED. Maybe I need to cycle them a few times?

The standard batteries that came in the radios were charged in the box already. I initially left them on overnight with the LED torch on to start their first cycle. I cycled each twice so far. All standard batteries show a solid green LED when charged.

So before approaching the seller of the BL-5's I am looking for some feedback. I did ask specifically if the CH-5 would charge the BL-5's perfectly - and was told yes. I just don't want to risk damage/fire from any future unattended charging of the BL-5's. I know there is a recommended charger - TYT . something .... to plug into the DC socket on the battery itself - I don't have one and understood I did not necessarily need one - but now? Also I didn't get a clear answer from my previous post if the "external" TYT type charger actually has LED indication to show the state of charge. Can anyone confirm if there are LED's to show Charging/Charged states?

Thanks, and aplogies for the windy post - but the more information I can give, the more my situation can be understood and any responedents are better equiped to help.

Thanks!

The US Army was using a version sold by Radio tone both simplex and duplex versions

The antennas were separated properly and the module was powered by a solar battery tank system.

results were mixed as the units were out on hills for training

Subject: [baofeng_uv5r] Re: Setting up a repeater system WITHOUT duplexer

You could buy a cheap, but good parrot repeater - depending on expected traffic. There are very low costs units that connect to your radio, record what they hear, then retransmit this seconds later. You only need one radio and they operate on simplex. Also you will want to consider the fact that hand helds are meant for short duration transmit only - anything over 60 seconds and you may be looking at increased heat. But for short info exchanges a hand held with a parrot repeater attached - up in a balloon or similar would be simple and have no desense to worry about. Worth considering.

That is illegal on so many aspects to use with FRS and GMRS. Any properly licensed and knowledgeable ham would know this and avoid doing it all all costs.

50624. Where are the DAT files keep on my computer?

From: johnpnorth@...
Topic: 50624 Message: 50624

I can see several .dat files I created when I use the stock Baofeng software example: open the software, click on files, open and I see the file tree and folder and .dat files, but if I use windows file explorer, the file do not appear just the program and uninstall files... Any thoughts/suggestions?

Thanks
John

Attachments: 1 described; binary payloads are missing from this source WARC

The default location for the software is the location that the software is installed. That location is a bad idea. That latest versions of Windows think that is a bad idea too so the put the file in a "virtual store". Area away from the programming but to the software it looks like it is in the same place.

I keep my .DAT files in my documents folder where they belong. But the software always defaults to the program folder and it is a pain to have to manually switch to the folder where you want to keep the files.

The solution that I use to get around this is to edit the shortcut that launches the OEM software. All you need to do is to put the folder that you want to store you .DAT files in into the "Start in:" location of the shortcut.

If you want to find the .DAT file in the virtual store, do this...

Click the Start button and put this text in the box that says"Search programs and files": %LocalAppData%\VirtualStore

Now click on the "VirtualStore" folder that appears. This will open the "VirtualStore" folder up in Windows Explorer so you can "drill" down from there to the folder where the .DAT files are.

50626. BF-F8HP in UK

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-07 23:09:48 UTC
From: calum.mackay@...
Topic: 50626 Message: 50626

hi all,

Has anyone in the UK managed to get hold of a BF-F8HP?

Unlike the several UV5R I've bought, I can't find any UK/EU-based sellers offering it on either Amazon or eBay.

I can find US sellers willing to ship to UK, but I'm worried: is it likely that it will be confiscated by UK Customs, as being not approved, etc?

Anyone managed to do this?

thanks much indeed.

thanks much for that...

> they now have the bf-f9v2

from what I read, the F9 V2+ is not a true Baofeng, instead made by Foscam - seems that some consider it a "fake", and claim it is assembled using old parts, firmware etc.

Whether that's true or not, that model is also not available from UK sellers, so my original question remains: does anyone have any knowledge about whether UK Customs might stop the import of this sort of radio handheld?

apologies if it's a little off-topic, but I thought I find people here who had done it...

thanks again...

Unplugging is interesting before dropping the radio in.. What did it seem to correct?
I've had two one or more year old charging UV-5R base's fail. Bought $5 Baofeng labeled replacements on EBay whose construction has been simplified. They work fine. This suggest that early bases had problems. On the new bases the bottom plate are snap on plastic. The early ones that failed had four screws holding on the back. The circuit board is changed also. Even the do nothing center charging connector pin was eliminated on the dock.
Seeing all the LED read out problem's on this site and my own troubles caused me to buy several $2 each three digit DC voltmeters on EBay and mount them simply on the front of the new charging dock's. Now I have confirmation of battery voltage very visible. It's neat and gives me confidence of the battery condition. A unexpected harmless result was the DVM's flash on and off at about 2 CPS flicker rate when no radio is in the dock. I don't have a scope anymore so guessing that the DVM's are seeing the chip in the charger sampling the battery voltage. Does anybody know?
The new docks read 8.3 VDC after a full charge. Perfect for long cell life according to the "Battery University" The wall wart says it's rated at 400 ma. Perfect for long cell life of Lithium Ion packs over 400 ma like the 1800 or 3800 are. The University says that the other thing that shortens cell life is discharging too far. So I discharge to 7.8 VDC on a 2 call pack max. With the DVM on the dock is easy to check.
Meanwhile I'm now using the BF888s for the 440 channels that I use and monitor. @ $14 shipped on EBay. You read correctly. They are a super HT and super cheap. I can't help myself when it comes to buying low - some say cheap - stuff. If the charging dock should fail, you can file 13 the whole dumb thing. Interesting thought huh? :-) @ $14 you can monitor every frigging 440 repeater in the book on individual HT's. Almost. Forget scanning! 73 Ken

In addition to all the other problems others have noted, you don't want to be violating Mexican law. Make sure you fully understand Mexican law re: ham radio, FRS/GMRS and radios that are legal in Mexico. Per Wikipedia:

Since tourists http://en.wikipedia.org/wiki/Tourism often bring their FRS radios with them, and since trade between the U.S., Canada, and Mexico http://en.wikipedia.org/wiki/Mexico is of great value to all three countries, the Mexican Secretary of Communication and Transportation http://en.wikipedia.org/w/index.php?title=Secretary_of_Communication_and_Transportation&action=edit&redlink=1 has authorized use of the FRS frequencies and equipment similar to that in the US. However, dual-mode FRS/GMRS equipment is not approved in Mexico, so caution should be exercised in operating hybrid FRS/GMRS devices purchased elsewhere.

Baofeng Tech (a USA based seller of Baofeng radios not to be confused with the Baofeng the Chinese manufacturer of Baofeng radios) is the exclusive seller of the BF-F8HP. If you find this exact model anywhere else, it is from somebody that purchased it from Baofeng Tech and is reselling it.

There are other Baofeng radio models available with 3 power levels now. You might even look for the INTEK KT-980 HP. It was actually available before the BF-F8HP. http://www.k-po.com/index.php

In addition to all the other problems others have noted, you don't want to be violating Mexican law. Make sure you fully understand Mexican law re: ham radio, FRS/GMRS and radios that are legal in Mexico. Per Wikipedia:

Since tourists often bring their FRS radios with them, and since trade between the U.S., Canada, and Mexico is of great value to all three countries, the Mexican Secretary of Communication and Transportation has authorized use of the FRS frequencies and equipment similar to that in the US. However, dual-mode FRS/GMRS equipment is not approved in Mexico, so caution should be exercised in operating hybrid FRS/GMRS devices purchased elsewhere.

2 radios and an audio cable.

i will be setting up this repeater on low power with the use of car antennas.

many off the HAMs in my area use this method with plenty of success.

On Jun 7, 2015 5:14 AM, "cprendon@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

If you don't mind spending about $25 you can buy the whole interface setup (radio to radio, not antenna) for this called Sainsonic RPT-2D. This can be tricky to get working, but no

more so than if you make the interface yourself. Especially if you are doing in band repeater where you have to have huge vertical separation between antennas without a duplexer. Choose your frequencies carefully and use low power transmit until you are sure you won't interfere with repeaters in your area. If you do up your power and you are going to leave it up, you should coordinate it with the authorities.

Good luck

---In baofeng_uv5r@yahoogroups.com, <bardya.aminian@...> wrote :

Hi,

I have 4 UV-5R's and I want to make a repeater with two of them. I'm going to buy a 2.5 to 3.5 mm cable adapter instead of a duplexer to save some money.

I just have a couple questions:

1) I'm planning on buying two car antennas and putting these onto my 20' mast which I've already set up. Will car antennas work?

2) How far apart do the antennas need to be? Doesn't the transmitting antenna deafen the receiving antenna because of the EMI?

Thanks.

50636. Hams and laws...

Topic: 50636 Message: 50636

A couple of recent posters have made comments along the lines that a properly licensed ham operator would know what is or is not legal in non-amateur radio services (including perhaps Parts 90 and 95).

I would argue that is not true, and from my experience, it is certainly not the case most of the time. This is not bad, nor is it discrediting any ham operator. There is no requirement to know any rules outside of Part 97 in order to get an amateur radio license, and I don't think there needs to be. Hams are licensed to operate only within the amateur bands, and they are required to know the regulations pertaining to those operations and those bands.

If there is one key item that should really be taught to hams, emphasized even (and normally isn't) it is that ham rules don't apply to anything else, that there are specific rules applicable to every radio service and they are only required to learn the rules that apply to amateur radio. If you want to operate outside the ham bands, then learn (and follow) the rules governing the frequencies you want to use, be they Part 95 personal radio services (CB, FRS, GMRS, etc.), Part 90 (business, commercial, industrial, public safety), Part 80 (Marine), or whatever else. And one other thing that every ham should have emphasized strongly in their education and training, just because a radio is capable of operating on a frequency doesn't mean it is legal to do so. Program your radio in the ham bands, use your radio in the ham bands, and operate in accordance with Part 97 (which you should know), and you will be just fine without knowing any rule about any other radio service.

Hello all. Just recently joined the group.
Been thinking about Ham Radio's for a long while, since last year in fact, mainly around the UV 5R HT by Baofung (now known as Pofung).
On youtube, I am amazed about how much is out there to actually use this HT, including the programming of it. Just a few days ago, I found a UV 5X handset (which has the claim of being waterproof and more professional), and can't seem to figure out if the accessories like Longer battery would also fit the 5X ??
No matter, I have not purchased anything yet, but have a little disposable income heading my way in the next few days.
So excluding the Handset, better Ariel, programming cable, is there any other must have items I am going to need for this hobby of Amateur Radio, to get the most enjoyment out of it !

Thanks in Advance.
Yours
Wayne Leiper.

G'Day Wayne

An Ariel is a motorbike, isn't it? :)

You don't actually need the handset or the better antenna, for that matter, to get started. The radio ityeself , as it comes, is enough for that.

You will need to decide though whether you actually want to go down the Ham Radio road, as it requires a licence anywhere in the world, or some other road outside of the amateur band allocations that are all beyond my ken.

the best advice I could give on Ham radio isd to seek out and join a local amateur radio club.

Bill, VK7MX

As a LICENSED Ham Radio Op for over 60 years, I find some of the stuff generated on this site as deplorable, illegal and down right stupid! Any Legally Licensed Ham would not dare use FRS and GMRS frequencies in conjunction with Ham Radio Repeaters. IT IS ILLEGAL! I also noticed most of the commenters use names and not Ham Call Signs, this leads me to believe that a lot of illegal crap goes on here! One this all of you wanna be Hams should know, HAMS POLICE THEIR OWN FREQUENCIES and we don't stand for any crap! We will turn you in faster than ice cream melts on the sun (idiot terms for idiots). So go ahead, make your little repeaters and cross band FRS or GMRS onto it. Legal Hams will be knocking on your door, not asking you to stop, MAKING you stop! As for causing interference to Public Service Emergency Services, your out of your minds, you will be caught and pretty fast. Just think, your friend down the street messing with a repeater screwing up the EMCOMM Services and your family needs an Ambulance, Fire Truck or maybe a Cop because your house has your kids and wife by the throat, Yeah just think about it for a minute! These little Baofeng radios are pretty neat, but NOT in the hands of stupid people!

Baofeng typically puts an "X" in the model number to indicate it is a VHF/220 radio. It was the UV-5RAX and UV-5RCX that used to be sold by Radio-Mart that were VHF/220 radios.

The only currently shipping VHV/220 model from Baofeng is the UV-82X (which I believe is exclusive to Baofeng Tech).

That being said, I have heard where on some of these special orders (the VHF/220 radios are special ordered by the vendors that sell them) the radios are mislabeled from the factory. I've heard in come case where the factory tried to "fix" the mistake with a "sharpie".

Another way to identify a VHF/220 radio is to look at the firmware version. VHF/UHF firmware versions typically end with an ODD number where VHF/220 firmware versions typically end with an EVEN number.

For example (UV-5R and variants):
BFB297 = VHF/UHF
BFB298 = VHF/220

For example (UV-82 and variants):
B82S21 = VHF/UHF
B82S26 = VHF/220

No reason it should be. It won't be not approved for anything until you use it, and in any case that's for Ofcom to worry about, not HMRC.

You will probably be billed for import duty and VAT, though.

Hi Bill... Yes, there is a Bike called the Ariel, the reasoning behind getting a better one is the reviews from the stock antenna. So will be getting one of 2 options, one is slightly longer, whip style and the other is a longer retractable whipstyle one.
The handset is the radio itself, more than likely it is going to be the UV5R ..
Am also thinking I may get a small dual band mobile ariel as well, and use that when am at home. But I will see what kind of reception I get with both the Stock and upgraded ariels first.

I am aware, that for a long time, I will not be permitted to actually key up or use the radio for any TX, as I will only be allowed to monitor, and have already looked up our local radio group, and plan on introducing myself to that in due course.

Thanks for the reply Bill

Best Regards

You can TX on UK PMR UHF, i.e. 8 channels at 446.0MHz.

That's limited to 0.5W ERP, although on "low" setting the UV-5R probably doesn't do much more than that.

See e.g. for more details and freqs:

https://en.wikipedia.org/wiki/PMR446#Analogue_FM

something to transmit on whilst you get your Foundation amateur licence, at least. That's what I'm doing, although the range limits it to family use... just for fun.

cheers,
calum.

As an example sometimes you insert a battery which has been partially discharged into a plugged in charger and it shows green. If you put that same battery into a charger not plugged in, then plug it in after the battery has been inserted, it will show red and start charging. That is one of the main things.

it probably really depends on the use you will be putting the radio, Wayne. If used mainly on local repeaters and for local simplex work, the flasher antenna will probably not make much difference. In fact, as recent comments on the group have described, a better antenna can intensify selectivity problems with simple SDR radios like the UV-5R. Because it is so so sensitive it is susceptible to other local signals of any significant strength, even some not that close in frequency.

I am not familiar with the RF environment of Aberdeen but I would suggest that you hold the money you are thinking of spending on additional aerials until you have chance to assess the native performance of the radio and its supplied aerial at your place.

Sorry for my typing errors in my first response.

Cheers
Bill

I've gotten my Technician ticket several weeks ago, and been
using a Baofeng UV-5R that I got through the course, chatted
with some folks on two meters.

My experiences are:
* The microphone in the HT works better than the speaker mic.
The HT microphone has low transmit audio, but the speaker
mic has extremely low TX audio.
* The only time I wore out a battery, left it on over night by
accident.
* Radio should be turned off, while in charge stand. Else
the charger tends to not know when to stop charging, and
damages the battery.
* Extended run 3800 mAH battery works fine, just a bit
longer in length, but no big deal.
* Magnet mount antenna for the car works worse,
in some urban areas. The receive doesn't work right.
I've had moments when the rubber ducky (provided with
the unit) worked better than a larger antenna.

Yes, I find it interesting that the Chinese radios come ready to transmit way outside the Amateur frequencies, which would encourage some to use those outside frequencies. I just purchased a Yaesu and it will only transmit on the allowed Amateur freqs. Differences in design criteria and philosophy obviously...

---In baofeng_uv5r@yahoogroups.com, <n7kuw@...> wrote :

A couple of recent posters have made comments along the lines that a properly licensed ham operator would know what is or is not legal in non-amateur radio services (including perhaps Parts 90 and 95).

I would argue that is not true, and from my experience, it is certainly not the case most of the time. This is not bad, nor is it discrediting any ham operator. There is no requirement to know any rules outside of Part 97 in order to get an amateur radio license, and I don't think there needs to be. Hams are licensed to operate only within the amateur bands, and they are required to know the regulations pertaining to those operations and those bands.

If there is one key item that should really be taught to hams, emphasized even (and normally isn't) it is that ham rules don't apply to anything else, that there are specific rules applicable to every radio service and they are only required to learn the rules that apply to amateur radio. If you want to operate outside the ham bands, then learn (and follow) the rules governing the frequencies you want to use, be they Part 95 personal radio services (CB, FRS, GMRS, etc.), Part 90 (business, commercial, industrial, public safety), Part 80 (Marine), or whatever else. And one other thing that every ham should have emphasized strongly in their education and training, just because a radio is capable of operating on a frequency doesn't mean it is legal to do so. Program your radio in the ham bands, use your radio in the ham bands, and operate in accordance with Part 97 (which you should know), and you will be just fine without knowing any rule about any other radio service.

I suppose I was worried that the latter might act on behalf of the former.

I have just found this on the HMRC website:

> Restricted Goods - Some categories of goods may be brought into the
> UK but only with permission and are known as restricted goods.
> Examples include:
>
> Some types of radio transmitters which are not authorised for use in
> the UK;

which is interesting.

So, the question would seem to be: does this happen in practice, with
posted goods?

Doesn't sound like anyone on here has tried it, though.

thanks anyway,
calum.

Well Christopher, evidently your NOT a licensed Ham! If you were you would be more careful of your frequencies and the way they are used! There are groups out there taking notes on how Hams use those frequencies, for the purpose of taking them away for personal gain, like Cell Companies, and other over zealous entities for profit! Ham Radio plays a very important part in EMCOMM (Emergency Communications in case your not a Ham). What amazes me the most is the way some people get there licenses, and it shows, almost like they got it out of a "Cracker Jack" box as a prize. No training, no responsibility, NO CLUE! As an Instructor, I can tell you that MY students come out with a License and the KNOWLEDGE on how to use it properly! My students can build a radio or repair it. Why is this important? Because now they have something worth having and the knowledge that goes with it. So if you think letting numnuts use any radio illegally is ok, then maybe you are in the wrong! Maybe you should go back to 11 Meters! Like I said, this is a great site for GOOD USABLE KNOWLEDGE about a nice little radio and it's cousins, why screw that up? Want to do illegal crap, start your own web site and go at it, leave good people who want to learn the real legal good stuff these radios can do alone!

Slams, and incorrect assumptions, both? Wow,
I hope you are not typical of amateur radio operators.

Actually, I've met several operators over the years. They
are generally very nice people, and have encouraged me.

So, why do you slam and assault people on the mailing
list? What motivates you? What do you wish to accomplish?
I'm often curious to hear from others who do things differently.

I find most Hams are helpful, informative and welcoming. There may be some rotten apples but that doesn't necessarily spoil the barrel.

Regarding "HAMS POLICE THEIR OWN FREQUENCIES", That does not mean we enforce the rules on others. What it does mean is that individuals keep themselves in check and observe and report others. The idea that hams can and should make someone stop illegal activity is naive and immature(and not a defense against prosecution).

I also disagree with the idea that hams should know the rules governing other radio services. Just because you have a driver's license does mean you know all the rules governing commercial trucking. I think we should concentrate on learning Part 97, as it obvious from this and other groups that many Hams don't know the rules or try to make them up as they go. If you break the rules of this or any other radio service, the FCC can impose hefty fines, seize your equipment and/or revoke your license. It's not worth it.

The hobby is exploding in membership. Many hams complain that the new licensees are not technically incompetent or lack good operating skills. This is where we as experienced operators should step in and elmer the new operators, instead of berating them. I commend Ron for conducting classes, but he rules do not require a class, so elmering is a way that we can help new operators become experienced operators.

You make think the "old guys" are grumpy, but maybe they are just trying to be informative. Could it be done better? In some cases, yes it can. But many Hams are passionate about this hobby and let that passion rule their comments. This thread is a perfect example. In some cases, however, this passion produce great results, as in the Hams that Ron is training.

One last note for anyone using this or many of the other radios like it. There is only one way to use these radios legally in the United States or anywhere under the jurisdiction of the FCC. Except for the few models that 100% comply with Part 90 rules, you must be a licensed Amateur operating on authorized frequencies with a radio that complies with technical specifications to minimize interference to others.

I don't know but I'll guess that the program written for the charger chip has voltage limits for initiating the charge cycle. Rebooting it apparently avoids them. These limits were probably decided on to get maximum life out of a pack. I venture to guess that the voltage on the pack was not low enough to start a charge cycle using that "rule". There's only "so many" charge cycles in a pack, however many that is. Why waste one on a almost full pack? It's well known that it's wasteful of pack life to discharge a pack below 40% or above 90% as I recall. (I think those numbers are correct! See Battery University). My UV-5R Docks read 8.3 VDC (A 2 cell pack) when it terminates the charge. Perfect when the max is 8.4 VDC and it's not good for the pack to get that fully charged. On the discharge side I'm very happy to see 7.6 VDC when first dropping the radio into a dock. Remember, I have a digital voltmeter add on to the dock and highly recommend the 2 dollar modification. This gives me confidence in getting the most out of a pack. 1000 cycles or more maybe? Based on experience with a cell phone pack I treat similarly, 5 years is possible. It's really funny on how much TLC I'll spend on a 30 buck radio!! Actual, the latest one bought on auction EBay was 26 dollars - delivered! Gee! I must nuts! Maybe so but I'm having fun! 73 Ken

One bad thing about this video, it is suggesting using freqs that are in the public safety area of Part 90. This requires a license to use, and probably freq coordination, also. These freqs can interfere with Fire, Police, Ambulance, and Search and Rescue. This set up should stay in the Amateur bands with properly licensed ham radio operators. It would still be easier to use a single ht that is capable of cross banding on its own, without going through the expense of 2 hts, a cable or interface unit, 2 extra

antennas, 2 coaxes, etc.

2 radios and an audio cable.
i will be setting up this repeater on low power with the use of car antennas.
many off the HAMs in my area use this method with plenty of success.
On Jun 7, 2015 5:14 AM, "cprendon@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

If you don't mind spending about $25 you can buy the whole interface setup (radio to radio, not antenna) for this called Sainsonic RPT-2D. This can be tricky to get working, but no more so than if you make the interface yourself. Especially if you are doing in band repeater where you have to have huge vertical separation between antennas without a duplexer. Choose your frequencies carefully and use low power transmit until you are sure you won't interfere with repeaters in your area. If you do up your power and you are going to leave it up, you should coordinate it with the authorities.

Good luck

---In baofeng_uv5r@yahoogroups.com, <bardya.aminian@...> wrote :

Hi,

I have 4 UV-5R's and I want to make a repeater with two of them. I'm going to buy a 2.5 to 3.5 mm cable adapter instead of a duplexer to save some money.

I just have a couple questions:

1) I'm planning on buying two car antennas and putting these onto my 20' mast which I've already set up. Will car antennas work?

2) How far apart do the antennas need to be? Doesn't the transmitting antenna deafen the receiving antenna because of the EMI?

Thanks.

What do you suggest in my circumstance...

Haven't used my radio enough to warrant a charge but when I plugged in my cradle charger the light was already green. It's not flickering.

Nothing changes when I insert a radio/battery

Actually, Calum, encouraging illegal activity is frowned upon. There are strict rules in the UK about using unapproved radios on PMR (similar to the US rules, but enforced somewhat more often).

Since Wayne made it clear that he intends to get an amateur license, it is good to see that he is already adopting the amateur radio operator's traditional respect for the rules.

We understand that you have no license and no respect for the rules, but please don't try to encourage others to follow you.

You can TX on UK PMR UHF, i.e. 8 channels at 446.0MHz.

That's limited to 0.5W ERP, although on "low" setting the UV-5R probably doesn't do much more than that.

See e.g. for more details and freqs:

https://en.wikipedia.org/wiki/PMR446#Analogue_FM

something to transmit on whilst you get your Foundation amateur licence, at least. That's what I'm doing, although the range limits it to family use... just for fun.

cheers,
calum.

Which is why some come to my table to yell at me and threaten to report me to the FCC for demo and selling radios. In the sense that we are the problem and cause of this. The first thing I say is “These are HAM radios that require a license to operate.” Our signs say HAM RADIOS. LICENSE Required a Free 4.7 GB DVD data disk is included in the radio box with all the rules and regulations, electronic courses, self study guides.

Along with the large number of study books, guides and disk on the table we still receive threats and face accusations for some type of violations. (All Coming from the Ham community)

We all wear badges with our call signs after being accused of selling radios unlicensed.

For those Hams out there that get angry when you see someone out in the public venue promoting Ham radio stuff either at show or swap meet, always remember this.

“Would you rather have a guy that is selling the radio explain the regulations, give warnings and provide step by step license instructions to a potential customer” (And having a policy of not selling to goofballs, kids, gang members and nut jobs)

or

“Would you rather have them buy a pair off Amazon and have them run on the Chinese test freq factory program instead OR start dialing in random numbers in freq mode for operation”?

I would rather have them on illegally on FRS/GMRS than on a repeater or on an important Public Safety freq. <--- lesser of 2 evils

When the prices are $30 and a pair at $60 you will soon find out that everyone will end up with one of these bought from the internet compared to a bubblepack pair that might cost more.

Using these radios illegally will NEVER stop when they can be found at $30 and from multiple sellers on the internet.

Tracking down kids playing airsoft on FRS/GMRS MURS with an UV5R would require a full time job (especially in this area)

The rules abuse will never end and will only get worse.

Subject:[baofeng_uv5r] Normally this is great site with good info BUT.....

As a LICENSED Ham Radio Op for over 60 years, I find some of the stuff generated on this site as deplorable, illegal and down right stupid! Any Legally Licensed Ham would not dare use FRS and GMRS frequencies in conjunction with Ham Radio Repeaters. IT IS ILLEGAL! I also noticed most of the commenters use names and not Ham Call Signs, this leads me to believe that a lot of illegal crap goes on here! One this all of you wanna be Hams should know, HAMS POLICE THEIR OWN FREQUENCIES and we don't stand for any crap! We will turn you in faster than ice cream melts on the sun (idiot terms for idiots). So go ahead, make your little repeaters and cross band FRS or GMRS onto it. Legal Hams will be knocking on your door, not asking you to stop, MAKING you stop! As for causing interference to Public Service Emergency Services, your out of your minds, you will be caught and pretty fast. Just think, your friend down the street messing with a repeater screwing up the EMCOMM Services and your family needs an Ambulance, Fire Truck or maybe a Cop because your house has your kids and wife by the throat, Yeah just think about it for a minute! These little Baofeng radios are pretty neat, but NOT in the hands of stupid people!

Radio-Mart announced last week that they were going to drop the sales of a large number of Chinese radios, TYT 9800 to be specific as one of them.

The reasons for this policy change is almost the same reasons others have gone out of business or did the same thing and some of my complaints.

1. Not very good factory support from the Chinese side

2. Q/C problems causing a large number of returns (mobile failures cost $$ to send back)

3. Constant calls for support from people that never bought them from RM (one of my complants and Craig’s too)

Those are the ones I can remember, not sure about all models of HT’s .

This might mean no more RM RAX versions or other types coming from them in the future.

I still have a couple of their UV5R RAX versions and Uv82 versions from RM

If you can get the Uv5R version get one and keep it as these are most likely never going to be made again in this case.

From: mailto:baofeng_uv5r@...m

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] 220 Mhz Baofeng?

Baofeng typically puts an "X" in the model number to indicate it is a VHF/220 radio. It was the UV-5RAX and UV-5RCX that used to be sold by Radio-Mart that were VHF/220 radios.

The only currently shipping VHV/220 model from Baofeng is the UV-82X (which I believe is exclusive to Baofeng Tech).

That being said, I have heard where on some of these special orders (the VHF/220 radios are special ordered by the vendors that sell them) the radios are mislabeled from the factory. I've heard in come case where the factory tried to "fix" the mistake with a "sharpie".

Another way to identify a VHF/220 radio is to look at the firmware version. VHF/UHF firmware versions typically end with an ODD number where VHF/220 firmware versions typically end with an EVEN number.

For example (UV-5R and variants):
BFB297 = VHF/UHF
BFB298 = VHF/220

For example (UV-82 and variants):
B82S21 = VHF/UHF

B82S26 = VHF/220

I just received a Paypal phishing email. It's the type that claims to come from Paypal and says I need to verify my account. Naturally it wants my password and other financial vitals.

The thing is, I always create a unique email address for ALL web sites I sign up to. This phishing email was sent to my 409shop email box. It would appear a disgruntled employee stole their customer database and is trying to make a fast buck.

So, be careful if you ordered from 409. Those Paypal emails are fake.

Quick notes:

Baofeng charger is very good. It gives a 400mA charge, current limited, and then switches to a 40mA charge to 8.4 volts, then the charge terminates. Textbook charging, from the internal chip that was designed for the purpose.

Indeed, 90% charge will double the cycle life. I am not convinced that use below 40% is disadvantageous, although it is a good voltage to store unused batteries at. I have modified my Baofeng charger to terminate at 8.2 volts to give a 90% charge. (I detailed the mod in a post two or three weeks back, it is VERY simple).

The little digital meters I saw were connected to the voltage they were measuring. They will take more than the 6uA that the Baofeng charger gives when the charge has terminated. Of course, if they power up separately, and take a very high impedance input to measure with, then all well and good.

I bought a 3800mA battery recently. It came with a charger, that charged it to 8.5 volts. Which, if you charge a 3600 battery to 8.5 volts, you get 3800, and a lot less charge cycles. Crafty devils.....

Oh.. My laptop battery is half gone. And five years old. Probably cycled less than 50 times, and kept at 40%.

Like you, Ken, I am spending a lot of time and effort on a cheap radio. Because it is what we do... :-)

Don't like the TYT charger. It does not have the accurate charge rates like the Baofeng one. It does work in a car, engine running, but the charge rate is not as high as it should be, as the LM317 is thermally limiting. It does not even have a heatsink. I fitted a buck regulator in my Baofeng charger, and it accepts 12-28 volts, outputs 10 volts to the charge circuitry and does not get hot at all.

Regards and 73,

Stan.

You're entitled to your opinion, of course, although I find that statement unfair, and also unreasonable.

I certainly have respect for the RSGB (etc) rules, which is why I wouldn't transmit on anything other than 446.0, and it's also why I ensure that the radio is on low power, and thus unlikely to be using (much) more than 0.5W, on "narrow", and using the stock aerial.

I also listen to ensure a channel is free (it always is around here), and I also use BCL to ensure I don't transmit over another (at least, if I am within range of them). Admittedly, I could be trampling over someone I can't hear, but then that's hardly unusual on PMR.

It's also why I paid £75 for an Ofcom Business Radio licence, so that I can broadcast at higher power --- still under 5W --- on a few other allowed frequencies. That is intended for occasional use, and indeed I've yet to transmit there.

I feel that I am at least following the spirit of the rules, and I encourage others to do so, too.

It may well be that using "non-approved" radios is not perhaps within the letter of the rules, although how one discovers whether a radio has approved status is not entirely clear to me.

your opinion, of course, I respect, if not necessarily agree with.

best regards,
calum.

that's one of the issues...

you can buy frs..gmrs radios at kmart for $10.

it's a special at their b&m locations.

the Motorola's sell at Sam's club for around $70

as a consumer... i wanted to buy a good set of ht's for trips.

i have no HAM background or knew of any prior to my uv5r ownership.

i did my research and apparently did it well.

for about $55 shipped i received two uv5r's with charging bases..hands-free...aftermarket antennas in addition to the stock pieces.

these severely outperform the radio's mentioned...even radios that cost 3x much.

i went hiking with my radios on low power...WOW...

i made a good purchasing decision...a very good one.

frs..gmrs..murs all programmed with alpha labels on the radio using chirp.

i have recd very useful info here on this site to improve the hardware and accessories performance and about the law.

i only need this radio for the walkie function... i am not concerned about listening to air traffic our dx'ing.

i only want a good walkie. ...and yep even better...i recd an excellent set.

don't want to be licensed at the moment...

i only need these to be good walkies.. they get used minutes a month when going on hiking and recreational trips.

i am not bragging our encouraging.. these are excellent radios and i am using them on channels that are already hardwired into bubble packs.

to date..i operate on MURS channels when in the mountains.

THERE IS NO TRAFFIC ON THESE CHANNELS

which is perfect for my use...if an emergency happens... our one of our groups gets lost... the radios ate thete to maintain contact.

next goal is to find a radio that can tx..rx on CB bands as well as frs..gmrs..murs.

it would be hard to discern my uv5r from other bubble packs whem i am hiking.

i guess people walk around with equipment to measure the tx strength on radios... then report them tho the authorities or get on the channel and berate them with regulations.

if i am on one of the public license free channels and comm'ing with other groups on safety checks, and a licensed ham is perturbed.

its been stated here that THEY WILL STOP ME....THEY WILL MAKE ME STOP.

i am curious as to how that will be accomplished.

again. .. murs...frs...gmrs... this radio has handled them far superior then any Motorola i have come across.

i am not here to brag.

i am not here to twist your knickers... i am here about the uv5r.

if you HAMS dislike people using bubble packs on gmrs..frs....some even have murs...

write to the fcc..

until then i will continue to use the radios with out a license for now.

i am glad the HAMS in my area are congenial and polite regarding my purpose for these.

i enjoy this group and it has been very informative. THANK YOU

THANK YOU TO MIKLOR

it sounds more like a mass spam and phish than anything else. I get spam from them as well and I have never been on their site.

anyway, depending on the email service you use, you might be able to filter out the spams. I use gmail here, but it seems their filter database is a bit poisoned as legitimate emails end up going into spam, even after I mark them as not spam.

anyway, these days, I use only 2 email accounts and I have a different password for each site I am registered with. so, if a phish/spam comes in and I go to that site, the password and username fields won't fill in (the password/username entries are very hostname specific). I know then that the site is bogus.

As it has been pointed out before, if you insist on breaking the rules, please do not brag about it or encourage others to do so. This is best kept to yourself. Then you won't hear us asking you to stop. I think there is another Baofeng UV-5 group that does encourage everyone to break the rules and brag about it. Perhaps you can go there.

It really is not that hard to follow the rules by getting a ham license, GMRS license, or keeping quiet about it. I like the way that those of us trying to encourage others to follow the rules are the 'bad guys' here. Go figure.

I believe this groups home page specifically points out that these radios are not legal in the US on MURS, GMRS, or FRS.

From: R Pryor MAEd CETsr
Topic: 50675 Message: 50683

Here some extra info and thanks for sharing because I order often from 409 shop.

Many of the Chinese computers have bootleg Windows OS installations. Computer stores will load the same windows disk for all their computers without getting the licensing. Microsoft started an aggressive program to identify bootleg copies and will issue warnings and usually disables windows update.

The result is millions of computers cannot patch or update from the MS sites, hackers then probe for known exploits and get into the system to steal info. The disgruntled employee is another cause too, as the common business technique in China is to operate with the min costs which creates a low pay and hostile work environment. Disgruntled employees are common or ones that work at a place long enough to steal the company secrets and setup their own competitive company. Bootleg patches and upgrades sold on the market often contain Trojans and other adware junk.

The Chinese DO not use our common browsing systems very much. Google, Yahoo, Messenger any of it. It is controlled tightly by the Chinese government, to meet the same internet capabilities they use Chinese only search engines, and certain instant messengers are used. One is called QQ and is very popular. Certain versions of fake QQ and search engine downloads are infected with payloads to steal data. When I was at my old university in Beijing, several students got passwords stolen from QQ infected delivery systems. If you use QQ or other systems to buy or chat for radio items BEWARE of this fact.

If ANY company uses QQ which 90% do (that is what you use for live chat on those alibaba trade sites) chances are they have a high probability of getting infected on their network via a QQ delivered payload.

An employee could have opened something and infected the whole 409 shop system. For those of us that give out credit card info BEWARE of this and monitor your accounts often to insure strange charges do not show up.

ReplyTo: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Warning, 409 Shop sending Paypal phishing emails.

I just received a Paypal phishing email. It's the type that claims to come from Paypal and says I need to verify my account. Naturally it wants my password and other financial vitals.

The thing is, I always create a unique email address for ALL web sites I sign up to. This phishing email was sent to my 409shop email box. It would appear a disgruntled employee stole their customer database and is trying to make a fast buck.

So, be careful if you ordered from 409. Those Paypal emails are fake.

It does (though always with the right of appeal), but it would not
affect import of transcievers.

There are in fact only three types of transmitter which would likely be
confiscated and which it is illegal to possess: AM CB rigs, Band II
broadcast rigs (except ultra-low-power devices) and broadcast TV
transmitters. Anything else you are free to hoard to your heart's
content, though of course you might not be allowed to switch it on!

This is completely separate from type-approval, which is something
customs neither know nor care about.

Topic: 50588 Message: 50685

I am not talking 'the big three'. If you want a big three ht that will crossband, you need the Yaesu FT-51r or the Icom 32a, both older units. I am talking like the Puxing px-uv973 at $75.00 and free shipping. One radio, one antenna, no extra cables, no antenna separation problems, small and compact.

2 Baofengs at $35.00 each and the Sainsonic interface box at $29.00, plus 2 antennas and coax to separate them properly, 3 items plus to pack around, etc, etc, the Puxing looks like a pretty good bargain to me. You can set it up easier as a portable unit with a 5-7 amp hour battery and mobile antenna alot easier than any combo using 2 hts and an interface.

Jardy Dawson
WA7JRD Ham Radio

These freqs can interfere with Fire, Police, Ambulance, and Search and Rescue. This set up should stay in the Amateur bands with properly licensed ham radio operators. It would still be easier to use a single ht that is capable of cross banding on its own, without going through the expense of 2 hts, a cable or interface unit, 2 extra antennas, 2 coaxes, etc.

> If you don't mind spending about $25 you can buy the whole interface setup (radio to radio, not antenna) for this called Sainsonic RPT-2D. This can be tricky to get working, but no more so than if you make the interface yourself. Especially if you are doing in band repeater where you have to have huge vertical separation between antennas without a duplexer. Choose your frequencies carefully and use low power transmit until you are sure you won't interfere with repeaters in your area. If you do up your power and you are going to leave it up, you should coordinate it with the authorities.

Topic: 50630 Message: 50686

One thing some hiking groups told us when hiking in the National forest area inside S California was the fact that a ranger stopped them and asked if they had their Ham radio licenses.

Cannot verify this story, however I heard it in different versions so it is a possibility this might have happened. It is really easy to get a license and allows you to do much more with the radios, I would make it a family or group project and get everyone licensed so you can do even more using the Ham bands while enjoying the outdoors.

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Normally this is great site with good info BUT.....

that's one of the issues...

you can buy frs..gmrs radios at kmart for $10.

it's a special at their b&m locations.

the Motorola's sell at Sam's club for around $70

as a consumer... i wanted to buy a good set of ht's for trips.

i have no HAM background or knew of any prior to my uv5r ownership.

i did my research and apparently did it well.

for about $55 shipped i received two uv5r's with charging bases..hands-free...aftermarket antennas in addition to the stock pieces.

these severely outperform the radio's mentioned...even radios that cost 3x much.

i went hiking with my radios on low power...WOW...

i made a good purchasing decision...a very good one.

frs..gmrs..murs all programmed with alpha labels on the radio using chirp.

i have recd very useful info here on this site to improve the hardware and accessories performance and about the law.

i only need this radio for the walkie function... i am not concerned about listening to air traffic our dx'ing.

i only want a good walkie. ...and yep even better...i recd an excellent set.

don't want to be licensed at the moment...

i only need these to be good walkies.. they get used minutes a month when going on hiking and recreational trips.

i am not bragging our encouraging.. these are excellent radios and i am using them on channels that are already hardwired into bubble packs.

to date..i operate on MURS channels when in the mountains.

THERE IS NO TRAFFIC ON THESE CHANNELS

which is perfect for my use...if an emergency happens... our one of our groups gets lost... the radios ate thete to maintain contact.

next goal is to find a radio that can tx..rx on CB bands as well as frs..gmrs..murs.

it would be hard to discern my uv5r from other bubble packs whem i am hiking.

i guess people walk around with equipment to measure the tx strength on radios... then report them tho the authorities or get on the channel and berate them with regulations.

if i am on one of the public license free channels and comm'ing with other groups on safety checks, and a licensed ham is perturbed.

its been stated here that THEY WILL STOP ME....THEY WILL MAKE ME STOP.

i am curious as to how that will be accomplished.

again. .. murs...frs...gmrs... this radio has handled them far superior then any Motorola i have come across.

i am not here to brag.

i am not here to twist your knickers... i am here about the uv5r.

if you HAMS dislike people using bubble packs on gmrs..frs....some even have murs...

write to the fcc..

until then i will continue to use the radios with out a license for now.

i am glad the HAMS in my area are congenial and polite regarding my purpose for these.

i enjoy this group and it has been very informative. THANK YOU

THANK YOU TO MIKLOR

On Jun 8, 2015 11:54 AM, "'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

Be aware that the Baofeng isn't type-approved for PMR446, but if you
don't advertise the fact that you're using one, and MAKE SURE you keep
within the frequency and power specification, no-one is likely to care.

From: Xaun Loc
Topic: 50642 Message: 50690

Opinions are like certain body parts, everyone has one.

I can't say that I agree with your approach that following "the spirit" of the rules is close enough, but I will grant that it is a lot less objectionable than far too many who simply don't care about the rules at all.

I could offer the Slippery Slope argument, but I'm sure you have heard that before.

My objection was not directed towards how you choose to operate, but rather toward encouraging someone else to follow your Close Enough method when that person had already expressed their intention of actually following the rules.

You're entitled to your opinion, of course, although I find that statement unfair, and also unreasonable.

I certainly have respect for the RSGB (etc) rules, which is why I wouldn't transmit on anything other than 446.0, and it's also why I ensure that the radio is on low power, and thus unlikely to be using (much) more than 0.5W, on "narrow", and using the stock aerial.

I also listen to ensure a channel is free (it always is around here), and I also use BCL to ensure I don't transmit over another (at least, if I am within range of them). Admittedly, I could be trampling over someone I can't hear, but then that's hardly unusual on PMR.

It's also why I paid £75 for an Ofcom Business Radio licence, so that I can broadcast at higher power --- still under 5W --- on a few other allowed frequencies. That is intended for occasional use, and indeed I've yet to transmit there.

I feel that I am at least following the spirit of the rules, and I encourage others to do so, too.

It may well be that using "non-approved" radios is not perhaps within the letter of the rules, although how one discovers whether a radio has approved status is not entirely clear to me.

your opinion, of course, I respect, if not necessarily agree with.

best regards,
calum.

I have to be amazed how many people believe the "From" line on emails - especially spam emails.

I've been a 409 Shop customer for years, and have never received a single email from them except specifically acknowledging an order.

Subject: Re: [baofeng_uv5r] Warning, 409 Shop sending Paypal phishing emails.

it sounds more like a mass spam and phish than anything else. I get spam from them as well and I have never been on their site.

anyway, depending on the email service you use, you might be able to filter out the spams. I use gmail here, but it seems their filter database is a bit poisoned as legitimate emails end up going into spam, even after I mark them as not spam.

anyway, these days, I use only 2 email accounts and I have a different password for each site I am registered with. so, if a phish/spam comes in and I go to that site, the password and username fields won't fill in (the password/username entries are very hostname specific). I know then that the site is bogus.

Personally, I like the Wouxun KG-UV8D for crossband repeating. I think it has a little cleaner audio. Also, I find that VHF in and UHF out tends to sound a little better also. Also, the UV8D has a remote stun/kill option for remote shutdown if needed. You can also quite easily program ready made channels, and if needed change CTCSS/DCS on the fly which then stays changed through a power cycle.

But don't expect to "rag chew" through the thing, it will get hot on 5 watts. For occasional use its great. Also by using a rollup j-pole hoisted into a tree, I get INCREDIBLE coverage on only one watt. And its only $119 shipped from buy two way radios dot com.

Just my 2 cents on quick and dirty.

Still alot easier than 2 Baofengs, an interface box, and 2 antennas with long coax and/or a mast. About the same costs, also. Hide the whole thing in a tree, real easy. Just don't forget to pick it back up again!

Of course no easy way to really ever know, but I'd bet if every Chinese radio manufacturer made their radios "locked" into only working the ham bands they would soon see a significant drop in sales volume, as I think the vast majority of these radios end up in three different markets - FRS/GMRS/MURS/Marine usage, commercial usage, and lastly amateur usage.

Subject: Re: [baofeng_uv5r] Re: Hams and laws...

Of course no easy way to really ever know, but I'd bet if every Chinese radio manufacturer made their radios "locked" into only working the ham bands they would soon see a significant drop in sales volume, as I think the vast majority of these radios end up in three different markets - FRS/GMRS/MURS/Marine usage, commercial usage, and lastly amateur usage.

On Mon, Jun 8, 2015 at 5:19 AM, Bill Maxwell wrmaxwell@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Made for different markets, actually.

Yes, I find it interesting that the Chinese radios come ready to transmit way outside the Amateur frequencies, which would encourage some to use those outside frequencies. I just purchased a Yaesu and it will only transmit on the allowed Amateur freqs. Differences in design criteria and philosophy obviously...

---In baofeng_uv5r@yahoogroups.com, mailto:n7kuw@... wrote :

A couple of recent posters have made comments along the lines that a properly licensed ham operator would know what is or is not legal in non-amateur radio services (including perhaps Parts 90 and 95).

I would argue that is not true, and from my experience, it is certainly not the case most of the time. This is not bad, nor is it discrediting any ham operator. There is no requirement to know any rules outside of Part 97 in order to get an amateur radio license, and I don't think there needs to be. Hams are licensed to operate only within the amateur bands, and they are required to know the regulations pertaining to those operations and those bands.

If there is one key item that should really be taught to hams, emphasized even (and normally isn't) it is that ham rules don't apply to anything else, that there are specific rules applicable to every radio service and they are only required to learn the rules that apply to amateur radio. If you want to operate outside the ham bands, then learn (and follow) the rules governing the frequencies you want to use, be they Part 95 personal radio services (CB, FRS, GMRS, etc.), Part 90 (business, commercial, industrial, public safety), Part 80 (Marine), or whatever else. And one other thing that every ham should have emphasized strongly in their education and training, just because a radio is capable of operating on a frequency doesn't mean it is legal to do so. Program your radio in the ham

bands, use your radio in the ham bands, and operate in accordance with Part 97 (which you should know), and you will be just fine without knowing any rule about any other radio service.

the rangers did not ask me about the radios..

there are do many that go up the trails with walkies...bubble packs. did not see any of the 2 rangers asking about anything related to ht's.

their main concern was not to feed the wild animals or approach to pet them.

radios set to low power and half charged stock batteries....they performed better than the larger in size higher prices Motorola' s and the like.

my radios included the uv82 antennas as well as the stock dead poles.

i disabled the Roger beep on the radios... perhaps that makes it more stealth?

i have read that there's sdr for android..Windows..Linux... wow...

i wonder how the uv5r can be incorporated into this?

if it can be used in a base camp.. hiking...recreational situation for comm.

The Yaesu is a ham radio and is configured as such. Most "Chinese" radios are not sold as ham radios, they are just popular with hams because of their low cost and because in the USA they are only legal on the ham bands.

Jim,

The vast majority of Chinese radio sellers portray the Chinese radios to whatever market they are attempting to sell into.

"If" Baofeng could only sell their Part 90 radios to folks with a commercial license or to hams, they would have long ago reached their sales levels and leveled out.

I've seen many Baofeng ads on Amazon and e-Bay (and at various hamfests) that market UV-5R's and UV-82's as "ham radios", but I've also seen loads of street sellers (usually at weekend events) program them with FRS/GMRS channels and then market the same radios as higher power "FRS/GMRS" radios.

This might be why a few weeks back my table attracted a couple of A-holes attempting to do a license spot check and threats to turn me into the FCC.

I never saw the guy but he claimed I told him he could talk on FRS/GMRS and whatever without a license- I never told ANYONE they could do this without a license. I found out this weekend others are selling them in nearby areas at the shows (from under the table no less) it is possible they are telling them this?

I lose customers that walk away as soon as I mention “License.” I would rather lose a customer then sell to someone not interested in doing things the right way.

YOU NEED a license is the first sentence I respond with when we have questions.

This helps to weed out those that do not want to get a license from us wasting our time explaining products. I would say 50% listen and ask questions then go buy online and I make it clear if they buy elsewhere we will not program them
when brought into the shows- which overwhelmed us in the past. We just cannot solve radio issues and watch table thefts at the same time.

Hiya folks, yes, the PMR frequencies are technically out of bounds (power wise) for the UV 5R .. As Un Underwood says, 0.5 watt to much. Will be another frequency I could monitor though. I was a little suprised when I saw the difference in the Tri Power units , only reaches 8 watts on some frequencies.. Shame that. But I guess it makes it a no brainer to get the 1w/4w version .. Which actually gets 5 watts on some channels ;)
I know I have a lot of researching to do, and a lot of maths to relearn, then there is the frequencies lists as well Q Codes, Morse Code and don't even get me started on the short form !!!
Lots to sort out and get the jist of. So I will take it nice and easy, have fun along the way.

Thanks again all.

Best Regards!

I purchased a Puxing UV-973 and cross-band operation was easy. I also liked the radio quite a bit more than the Baofeng, so I bought a second. Only caveats are to run low power on both bands and use a dual band antenna with good SWR on both bands. Cross-band operation with Puxing was very nice.

Amen!

PRSG hurt GMRS badly when they conned the FCC into making it a cash cow for commercial radio shops -- but the FCC finally killed GMRS as a useful radio service when they approved the ^%*&^%*&^% hybrid GMRS/FRS radios.

Today we have a government agency responsible for regulating radios staffed by people who have no idea what a radio is and who can't even manage to read their own regulations - as evidenced by approval of the BaoFeng UV-5R and the Dakota Alert (QK8MALERT), but at least they did refuse to approve the Anytone 8R junk

Which is why some come to my table to yell at me and threaten to report me to the FCC for demo and selling radios. In the sense that we are the problem and cause of this. The first thing I say is “These are HAM radios that require a license to operate.” Our signs say HAM RADIOS. LICENSE Required a Free 4.7 GB DVD data disk is included in the radio box with all the rules and regulations, electronic courses, self study guides.

Along with the large number of study books, guides and disk on the table we still receive threats and face accusations for some type of violations. (All Coming from the Ham community)

We all wear badges with our call signs after being accused of selling radios unlicensed.

For those Hams out there that get angry when you see someone out in the public venue promoting Ham radio stuff either at show or swap meet, always remember this.

“Would you rather have a guy that is selling the radio explain the regulations, give warnings and provide step by step license instructions to a potential customer” (And having a policy of not selling to goofballs, kids, gang members and nut jobs)

or

“Would you rather have them buy a pair off Amazon and have them run on the Chinese test freq factory program instead OR start dialing in random numbers in freq mode for operation”?

I would rather have them on illegally on FRS/GMRS than on a repeater or on an important Public Safety freq. <--- lesser of 2 evils

When the prices are $30 and a pair at $60 you will soon find out that everyone will end up with one of these bought from the internet compared to a bubblepack pair that might cost more.

Using these radios illegally will NEVER stop when they can be found at $30 and from multiple sellers on the internet.

Tracking down kids playing airsoft on FRS/GMRS MURS with an UV5R would require a full time job (especially in this area)

The rules abuse will never end and will only get worse.

I heard a ham local to me who uses GMRS frequencies to cross band to 2 meters. I was in a work break or I would have shredded him on the air. A lot of hams nowadays are nothing more than "cbers with a call sign" and care nothing for regulations. The hobby is disintegrating in the USA.

Subject:[baofeng_uv5r] Normally this is great site with good info BUT.....

As a LICENSED Ham Radio Op for over 60 years, I find some of the stuff generated on this site as deplorable, illegal and down right stupid! Any Legally Licensed Ham would not dare use FRS and GMRS frequencies in conjunction with Ham Radio Repeaters. IT IS ILLEGAL! I also noticed most of the commenters use names and not Ham Call Signs, this leads me to believe that a lot of illegal crap goes on here! One this all of you wanna be Hams should know, HAMS POLICE THEIR OWN FREQUENCIES and we don't stand for any crap! We will turn you in faster than ice cream melts on the sun (idiot terms for idiots). So go ahead, make your little repeaters and cross band FRS or GMRS onto it. Legal Hams will be knocking on your door, not asking you to stop, MAKING you stop! As for causing interference to Public Service Emergency Services, your out of your minds, you will be caught and pretty fast. Just think, your friend down the street messing with a repeater screwing up the EMCOMM Services and your family needs an Ambulance, Fire Truck or maybe a Cop because your house has your kids and wife by the throat, Yeah just think about it for a minute! These little Baofeng radios are pretty neat, but NOT in the hands of stupid people!

I would bet that the Rangers involved are themselves licensed hams.

One thing some hiking groups told us when hiking in the National forest area inside S California was the fact that a ranger stopped them and asked if they had their Ham radio licenses.

Cannot verify this story, however I heard it in different versions so it is a possibility this might have happened. It is really easy to get a license and allows you to do much more with the radios, I would make it a family or group project and get everyone licensed so you can do even more using the Ham bands while enjoying the outdoors.

Subject: Re: [baofeng_uv5r] Normally this is great site with good info BUT.....

that's one of the issues...

you can buy frs..gmrs radios at kmart for $10.

it's a special at their b&m locations.

the Motorola's sell at Sam's club for around $70

as a consumer... i wanted to buy a good set of ht's for trips.

i have no HAM background or knew of any prior to my uv5r ownership.

i did my research and apparently did it well.

for about $55 shipped i received two uv5r's with charging bases..hands-free...aftermarket antennas in addition to the stock pieces.

these severely outperform the radio's mentioned...even radios that cost 3x much.

i went hiking with my radios on low power...WOW...

i made a good purchasing decision...a very good one.

frs..gmrs..murs all programmed with alpha labels on the radio using chirp.

i have recd very useful info here on this site to improve the hardware and accessories performance and about the law.

i only need this radio for the walkie function... i am not concerned about listening to air traffic our dx'ing.

i only want a good walkie. ...and yep even better...i recd an excellent set.

don't want to be licensed at the moment...

i only need these to be good walkies.. they get used minutes a month when going on hiking and recreational trips.

i am not bragging our encouraging.. these are excellent radios and i am using them on channels that are already hardwired into bubble packs.

to date..i operate on MURS channels when in the mountains.

THERE IS NO TRAFFIC ON THESE CHANNELS

which is perfect for my use...if an emergency happens... our one of our groups gets lost... the radios ate thete to maintain contact.

next goal is to find a radio that can tx..rx on CB bands as well as frs..gmrs..murs.

it would be hard to discern my uv5r from other bubble packs whem i am hiking.

i guess people walk around with equipment to measure the tx strength on radios... then report them tho the authorities or get on the channel and berate them with regulations.

if i am on one of the public license free channels and comm'ing with other groups on safety checks, and a licensed ham is perturbed.

its been stated here that THEY WILL STOP ME....THEY WILL MAKE ME STOP.

i am curious as to how that will be accomplished.

again. .. murs...frs...gmrs... this radio has handled them far superior then any Motorola i have come across.

i am not here to brag.

i am not here to twist your knickers... i am here about the uv5r.

if you HAMS dislike people using bubble packs on gmrs..frs....some even have murs...

write to the fcc..

until then i will continue to use the radios with out a license for now.

i am glad the HAMS in my area are congenial and polite regarding my purpose for these.

i enjoy this group and it has been very informative. THANK YOU

THANK YOU TO MIKLOR

One other advantage of the TYT charger is that TYT remembers to correctly solder all the connections - something that the children working for BaoFeng forget rather too frequently.

From: mailto:baofeng_uv5r@yahoogroups.com

To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Re: BL-5 Battery - goes bang!

Quick notes:

Baofeng charger is very good. It gives a 400mA charge, current limited, and then switches to a 40mA charge to 8.4 volts, then the charge terminates. Textbook charging, from the internal chip that was designed for the purpose.

Indeed, 90% charge will double the cycle life. I am not convinced that use below 40% is disadvantageous, although it is a good voltage to store unused batteries at. I have modified my Baofeng charger to terminate at 8.2 volts to give a 90% charge. (I detailed the mod in a post two or three weeks back, it is VERY simple).

The little digital meters I saw were connected to the voltage they were measuring. They will take more than the 6uA that the Baofeng charger gives when the charge has terminated. Of course, if they power up separately, and take a very high impedance input to measure with, then all well and good.

I bought a 3800mA battery recently. It came with a charger, that charged it to 8.5 volts. Which, if you charge a 3600 battery to 8.5 volts, you get 3800, and a lot less charge cycles. Crafty devils.....

Oh.. My laptop battery is half gone. And five years old. Probably cycled less than 50 times, and kept at 40%.

Like you, Ken, I am spending a lot of time and effort on a cheap radio. Because it is what we do... :-)

Don't like the TYT charger. It does not have the accurate charge rates like the Baofeng one. It does work in a car, engine running, but the charge rate is not as high as it should be, as the LM317 is thermally limiting. It does not even have a heatsink. I fitted a buck regulator in my Baofeng charger, and it accepts 12-28 volts, outputs 10 volts to the charge circuitry and does not get hot at all.

Regards and 73,

Stan.

Rangers on federal land do not need "authorization from the FCC" -- as federal law enforcement officers they are responsible to enforce ALL federal laws, including Title 47 of the United States Code and the Code of Federal Regulations.

I would demand to see his authorization from the FCC
for him to ask for my authorization. It's only fair.

What about Meter Maids in D.C. ? They are on Federal Lands.

I'd still ask for their authorization and to prove that I had actually transmitted instead of monitored.

Barney Fyffe in a Smokey Bear hat better have probable cause to search my backpack.

I used to take a hard line approach, but I'd see those same folks at the next show using their UV-5R's (and/or other Chinese radios) programmed for FRS, or GMRS, or MURS, etc., etc., after purchasing them on Amazon or e-Bay and then asking question after question (on this forum and others like it) on how to program their radio for FRS, or GMRS, or MURS anyway.

With so many folks on so many forum groups all too eager to help them get their radios on non-authorized frequencies anyway, and seeing the writing on the wall that there will always be some quick to jump in and help provide step by step instructions (including complete Chirp templates for FRS/GMRS/MURS, etc.), it seems pointless to keep swimming upstream as one of the few (and yes there still are a few) to point out the legality of using the radios outside of Part 90 or Part 97 services.

Perhaps with age I've mellowed out a bit (for example I used to always carry a full sized 1911, but now I carry a small Kahr 9mm at shows and usually only carry a Springfield XD Full Size for non-show weekends), but I always explain to the prospects that if "range" is their over-riding issue (99% of the time it is), they will always be able to talk further than their buddies (that appeals to their ego) with a simple Tech license.

If time permits, I'll sometimes also show them really long distance conversations using IRLP as well, which normally causes a few of them to immediately ask "How are you doing that with such a small antenna?"

What we won't do is compete with the Chinese selling non-FCC Part 90 approved radios based on below dealer pricing. Our programming templates cost me time to develop, check and update. Radios we sell (all Part 90 approved) are tested before they ever see a customer, which takes both time and money for test equipment, shop space, etc.

Everyone else working always thinks they aren't paid enough for their skills (whether they be a Carpenter, Dentist, Doctor, Electrician, Mechanic, etc.) - yet those same individuals sometimes think everyone that's involved in what they consider a hobby (guns, radios, etc.) should sell stuff at cost (or below cost) and work for free. I disagree.

I actually got one of our customers (that purchased non-FCC Part 90 radios elsewhere) to let me have two of the most defective units that we use for display purposes at shows.
